DUROC BARGAINS IN ASSOCIATION SALE
The annual sale of bred sows and gilts held by the California Duroc-Jersey Breeders' Association at the university farm, Davis, February 8, happened to fall on one of the most inclement days of the winter and as a consequence the attendance was limited to local buyers who were not disposed to set values in keeping with the offering.
Twenty-four head from 14 of the leading herds made the low average of a few cents under \$50. In general the offering was of uniform quality although there were some lots that hardly seemed in place in an association sale. Marked preference was manifested for animals showing advanced type and size, and buyers did not hesitate to loosen their purse strings on such lots. The cheaper sorts were all of useful character and will prove decided bargains for their new owners.
A fall yearling of correct type, with lots of size and quality, sired by Mammoth Sensation and out of Lucy Pathfinder, consigned by the Diamond Bar Ranch, topped the sale at \$205. She was taken by the Western Laboratories of Stockton. The same firm secured an outstanding gilt of like age, a daughter of Choice Wonder 3d, for \$125. Many regarded this gilt as the top of the offering.
The sale was completed by the association, with V. F. Dolcini of Davis acting as pedigree man, H. C. Witherow of Live Oaks as clerk, and Ord Leachman of Sacramento as auctioneer. The consignors were: University Farm, Davis; Golden Star Farm, Vacaville; W. M. Way & Son, Modesto; V. F. Dolcini, Davis; L. J. Beaver, Fresno; Harvey M. Berglund, Fresno; Diamond Bar Ranch; H. P. Clocum & Son, Willows; W. M. Cutler, Davis; A. D. Long, Davis; R. E. Clifford, Davis; C. L. Gregory; J. E. Thorp, Lockeford; Witherow & Stafford, Live Oak.
The offering was absorbed by the following buyers: Western Laboratories, Stockton; H. C. Kunze, Davis; L. A. Webb, Davis; R. H. Lippert, Sacramento; Witherow and Stafford, Live Oak; V. F. Dolcini, Davis; George Jefferys, Vacaville; J. F. Wilman, Dunsmuir; E. Griffith, Woodland; R. E. Clifford, Davis; F. W. Barclay, Tracy and I. W. Comstock, Winters.

DIRECTORY OF NURSERYMEN
The state department of agriculture has in bulletin form reprint of California laws affecting nurserymen, to which is appended a list of all California nurseries with their classification and location. Any interested may secure it by writing to the department at Sacramento.

DOLCINI HAS TOP SALE OF SEASON
The first public sale of Duroc-Jersey bred sows and gilts from the June Acres herd of V. F. Dolcini, was entirely successful and resulted in an average of close to \$60. Furthermore the sale demonstrated that there is no grounds for the dejected attitude of the majority of California swine breeders. There is no question but that California is way short on hogs and that ranchers, realizing that hogs offer them their most profitable outlet for grain, are in the market and willing to pay fair prices for breeding stock. The war is over and likewise war prices for breeding stock, and any breeder who is willing to offer breeding material at reasonable prices will find a ready trade.
The sale featured the services of the Dolcini herd boar, Choice Wonder 3d, the 1920 grand champion, and the result can be taken as evidence of the esteem accorded him by breeders and farmers. A \$200 top was established on the aged sow, June Acres Wonder Lady, purchased by A. D. Long of Davis. Aside from the top the balance of the offering sold at a uniform range of prices. Ord L. Leachman cried the sale.
The following appeared as buyers: A. D. Long, Davis; C. B. Phillips, Dixon; H. P. Slocum and Son, Willows; C. A. Graf, Winters; University Farm, Davis; George Jeffery, Vacaville; Fred Smith, Davis; C. L. Gregory, Shasta; C. W. Scott, Winters; H. W. Comstock, Winters; R. H. Lippert, Sacramento; Frank Campbell, Davis; L. A. Webb, Davis; H. C. Kunze, Davis; H. B. Traynham, Davis; G. C. Wood, Danville.

CERTIFIED CHICKS IN ALAMEDA COUNTY
The poultry department of the Alameda County farm bureau has adopted a definite plan certifying chicks from inspected flocks. In addition to the rigid inspection given the breeding flocks this year (retaining only those birds of the required age which show good type, capacity, vitality and are laying during the September-December period) the male birds must have an authentic trapnested record on one side of at least 200 eggs and in addition conform to the type for the breed and be ten months old before being placed in the breeding pens. The following year the cocks must have a trapnested record of 200 eggs or better on both sire and dam side. The next year it must be for two generations. It is evident therefore that the Alameda County breeders have undertaken a sound and practical plan for flock improvement. Henceforth it is not enough to have just a "rooster"—he must be a "trapnested sire." The hatcheries are cooperating with the breeders and an agreement to handle only eggs from inspected flocks is in force.
Enough cockerels to supply the breeding pens with birds of the required standard have already been signed up for the 1922-23 season. These will be banded and registered with the poultry department of the farm bureau. The farm advisor's office has cooperated with the poultrymen in this movement.—Russell T. Robinson, County Agent.

QUERIES
(Continued from Page 183.)
through the ads in Eastern pet stock magazines would be the best way to get the information.
Producing Turkeys
Am raising turkeys without much success. Will you please tell me where I can get information on this subject?—Subscriber.
There have been several articles in the California Cultivator touching upon breeding and care of turkeys but

we regret that we have in our library no book on general turkey raising excepting Mrs. Koethen's "Poultry for Profit," which treats on turkeys in one chapter. This book, by the way, is the biggest value we know of for \$1 and if republished today would necessarily sell at \$2 per volume. This may be had by writing this office. Write the United States Department of Agriculture, Washington, District of Columbia, and ask for Bulletin 791. Also write Washington State Experiment Station, Pullman, Washington, and ask for Popular Bulletin No. 86, "Turkeys."

Wormy Pears and Peaches
Please let me know what kind of spray to use for codling moth in pears and peaches and when to use it.—Subscriber.
The method for handling codling moth is to spray with arsenate of lead about the time the trees are finishing blooming and again in two or three weeks with repetitions of the treatment and after that at intervals throughout the season of three or four weeks. In this spraying the only effort should be to get the spray on the fruit, especially in the blossom end. Formulae for the arsenate sprays may be found on page 314 of the spray special of September 24, 1921. By referring to peaches we presume the inquirer is asking as to the peach worm or twig borer. This pest affects both the twigs and the fruit. It may be controlled to an extent at least by spraying with lime-sulphur spray just as peach buds are beginning to swell. The state department of agriculture is issuing new information as to the control of this pest which will be given in a later issue of the Cultivator.

VETERINARY
(Continued from Page 195.)
and milking it out about three or four times a week until she is fresh. There is little or no use applying anything to the outside. If she refuses the salts you might drench her with some of it dissolved in water once or twice a week but if you can keep her bowels free by feeding green feed or some roots then do not bother with the salts. Reduce her feed until she

comes fresh even if she does lose a little flesh. Since she shows so little recation from the test you may as well forget it. There is no use of testing her over and over again.

CHAMPION TURKEY
Mr. Van Ness of the Bronze King Farm of Merced writes regarding a recent purchase of a Giant Bronze cock turkey, Goldbank VIII. Goldbank was the first prize winning cock at Madison Square Garden, 1921. A winner at Madison Square has to be well up toward 100 per cent good. Goldbank was preceded in its trip to California by Goldbank Boy, a first prize winner. Presumably the price paid for such birds is in the class "strictly fancy prices." This progressive poultry farm has also secured this year's third prize cockerel at Madison Square Garden, being a grandson of Copper King V, and is now negotiating for and expects to secure this year's winning cockerel at the same show. The introduction of such blood will add materially to the wealth of California.

FIFTIETH ANNIVERSARY
Organized in 1872 with less than \$2,000 capital, Montgomery Ward & Company of Chicago has grown to be one of the greatest commercial institutions of the country. Both Montgomery Ward and his early partner, George R. Thorne, have passed, but the great concern continues to grow and make good its slogan, "Render the public a genuine service—sell only honest goods at lowest prices." Regarding conditions as they were at the time of the organization of the company the jubilee number of their catalog says: "There were no telephones in 1872, no electric lights, no electric street cars, no typewriters, no department stores. The first Atlantic cable had just been laid, and Chicago, a city of less than 300,000 people, was rising from its ashes. It was the year after the great Chicago fire, which burned over 17,000 buildings and made 100,000 people homeless."
This catalog, by the way, is a mammoth book of 642 pages with literally thousands of illustrations. Many of these are color plates giving a most excellent idea not only of style and cut but of colors and most delicate shades.

THE KILLEFER
MEDIUM WEIGHT
AUTOMATIC DISC
HARROW
FOR LIGHT TRACTORS
FIVE FOOT
\$132.50

The Killefer Quality Automatic Disc Harrow at this new price offers the maximum of implement value for orchard and vineyard work.
There are many desirable features of construction in this small tractor disc harrow. No part is higher than the discs. The discs are of unusual weight with large bumpers. Flange fitted boxes keep out grit. Well lubricated bearings fitted with grease cups—Discs kept clean by rigid cleaners. Gangs are rigid in operation and will not buckle. Hold down bars may be removed to operate gangs flexible.
Built in 5, 6 and 7 foot sizes with 18 inch discs for medium sized tractors.

Write for particulars.

Save the Fruit Trees

Why are the home orchards dying? Because they are not sprayed—there is no other answer. Unless you spray, you are going to lose your trees. A Hardie Sprayer will save them and earn big profits from them. There is a Hardie right in size, price, and capacity, no matter how large or how small your orchard.

We believe that every reader of the California Cultivator will become a user of Coast Tires as soon as the real merits and advantages of the tires are understood.

Any Coast Tire Dealer will gladly explain the construction of Coast Tires and demonstrate the features that insure the great mileage and service that you are assured when you purchase Coast Tires.

Eventually there will be a Coast Tire Store in every city and village on the Pacific Coast. Already we have a large list of dealers, but if there should be none at your purchasing point, fill in and mail the coupon printed below, and we will send you complete details of the tire, prices, and instructions for ordering by mail.

One of the Newer and Better Varieties of Grain Sorghums---White Yolo

New Price
\$295

f. o. b. Factory

Standard Walking Type Now Sells For Less

Standard Walking Type Utilitor
with Plow

Standard Walking Type Utilitor
Equipped with 84-inch Mowers

New Riding Type, Model 501-A
\$340 f. o. b. Factory

YOU CAN now own one of these handy, money-making, time-saving machines for less money. The Utilitor has proved its ability on hundreds of farms to do better, faster and less expensive work than animal power.

On the belt it has no equal for its size. It moves from job to job under its own power.

All hitches have been simplified and perfected.

We are also offering the NEW RIDING TYPE Utilitor. It steers from a comfortable seat by means of a tiller control. Most of the operations are watched from the driving position.

The New Riding Type sells for \$340 f. o. b. factory. Ask for Model 501-A.

With increased discount and reduced prices the Utilitor is more attractive than ever from the dealer's standpoint.

Complete description of all models on request. Please address Department 302

MIDWEST ENGINE COMPANY, Indianapolis, U. S. A.

NEW SERIES

Overland

"The Most Economical Car I Have Ever Driven"

Thousands of farmers who drive Overlands could say just as much as this farmer-owner writing from Oregon.

Twenty-five miles and upwards to the gallon of gas is very common—with high mileage for oil and tires.

Low first cost plus low operation and upkeep expense make the New Series Overland today's outstanding automobile value.

CUT DITCHING COST

**Prices Slashed
No More Shoveling!**

No more plows, slips, fresnos, or "go-devils." The MARTIN makes the ditch from start to finish, any depth, up to 4 feet. It cleans old weed-grown and silt-filled ditches in jig time.

**For Irrigation or
Drainage**

For small laterals or big ditches; for terracing, rice levees, alfalfa checks and borders and for road building. The MARTIN does the job.

For Horse or Tractor Use

This all-steel, adjustable and reversible implement is made in four sizes. It is sold in every state. Write today for big free catalog.

Birdseye View of This and Past Years' Freezes in Southern California

A PROPER perspective is not an easy thing to acquire, whether it be physical or mental. However, in the consideration of past and present weather conditions it is not difficult to see the effects of this year's freeze from an airplane or, by means of climatological statistics, to compare this year with temperature records extending to 1877 in the case of Los Angeles and to 1852 of San Diego.

The writer made an extensive flight

Wasting Away to the Ocean
Photograph taken by Dr. Carpenter from airplane, February 6, 1922, showing Temecula River pouring its waters into the Pacific which is 30 miles away. Photograph was taken from a point about 1,000 feet above the river which is approximately 1,000 feet above sea level.

on February 6, 1922, over the greater part of the citrus district of Southern California, and a rapid and superficial survey was made of frost damage. By means of comparative curves of Los Angeles and San Diego this year's temperatures may be readily studied with reference to the occurrences of half a century and over. The result of such surveys may not be without interest at this time, when nearly every one is asking himself, "How widespread is the frost damage?" "Is the climate of California getting colder every year?" and "How best to prepare for infrequent but inevitable frosts?"

The basket of a balloon, the pilot's seat in a dirigible, or the cockpit of an airplane offer ideal observation points for the study of the ground. From an airplane last week it was possible to obtain a rapidly moving panorama of some of the relative damages to citrus plantings by noting the varying shades of color, which ran the gamut from the deep green of untouched orange groves to the seared yellow of the frozen lemon groves. Passing over foothill groves it was remarked that the plantings near the debouching valleys were generally untouched owing to the effective air drainage. The destruction of certain varieties of native growth in the river bottoms, which was evidently 12 or 14 years of age, was practically widespread. At an altitude of a couple of thousand feet the effect of artificial heating upon citrus groves was very

By Dr. Ford A. Carpenter, Manager Department of Meteorology and Aeronautics, Los Angeles Chamber of Commerce

apparent; the protected groves stood out by contrast like oases in a desert. Aviators report that during the protracted period of cold weather the smoke of the oil pots rarely extended above the 1,000 foot level and in no case reached higher than 1,200 feet. This year's frost is the tenth since 1877 and, although the most damaging since 1913, in all probability is only one of four or five serious freezes which have visited Southern California in the past half a century. Six features contributed to making the present frost an injurious one.

First, the enormous extension of the citrus industry. This is shown by the generous planting of lemons and oranges, whose acreage has become so great as to require unusual skill in marketing during the past decade. Such extensions mean greater aggregate frost losses.

Second, plantings have been made in localities where nature never intended tender trees should be grown. For the time being it was forgotten that Southern California has not a tropical, or, strictly speaking, a semi-tropical, climate.

Third, the present freeze was preceded by a long period of generally frost free years which produced overconfidence in the grower.

Fourth, the rains of the four or five weeks before the recent freeze were unusually warm, causing almost unprecedented growth and abundance of sap.

Fifth, this same rainy period interfered with proper placing and care of the artificial heating appliances.

Sixth, too much reliance was placed on so called natural immunity from frosts and inefficient frost fighting equipment.

A study of past frost records is most instructive, proving that Byron was right when he wrote: "The best of prophets of the future is the past."

The following table shows all occurrences of temperatures below freezing in the Los Angeles district during the past 46 years. Twelve frosty periods occurred during this nearly half century, or, on an average, one year in four. The frostiest group of years was from 1878 to 1880, inclusive, and the longest period without frost was between 1902 and 1912.

Days Temperature Below 32 Degrees at Los Angeles Since 1877

(Records of United States weather bureau, standard government roof exposure of thermometers.)

Year	Month	Date	Temp.
1878	December	14	30
1879	December	25	30
1880	January	29	30
1883	January	20	30
1883	February	3	30
1883	February	6	28
1888	January	9, 10, 16	31
1893	March	9	31
1897	December	21	30

1898	January	26	31
1901	December	13	31
1913	January	6	30
1913	January	7	28
1922	January	20	31

(Attention is called to the fact that the records reported by these figures are made in city environment. Orchard temperatures for the period reported are not available.)

In a majority of instances frosty years are wet years, and a group of dry years is invariably notable for warm winters. Such findings fit very well into the general scheme of things

"Is the Climate Changing?"
This question is frequently asked, and the answer is graphically given in this chart, decidedly replying in the negative. The recent cold spell with its attending destructive frosts impressed many with the belief that the climate of Southern California was becoming colder. Perusal of these comparative curves of temperature during periods of 70 and 45 years will convince the most skeptical that there is no progressive change in climate.

The record at San Diego, which began in 1852, is the longest record in Southern California, and one of the few uninterrupted governmental series of observations in the country. Charted with the San Diego record is the much shorter record of Los Angeles. These lines show two important facts: 1. The weather at San Diego or Los Angeles is not becoming warmer or colder with the progress of the years. 2. That temperature changes are general over Southern California, which fact is proven by the regularity of the difference between the temperatures at Los Angeles and San Diego.

meteorologically considered. It is an axiom that any disturbance in the delicate balance of weather equilibrium must of necessity find expression in extremes. We may visualize this if we recollect how when standing on the seashore we see the on-coming waves. Whenever there is an unusually high crest there is always a proportionately deep trough. So it is with the great atmospheric waves that follow in procession around the earth from west to east. They are shown on the weather maps as "highs" and "lows" and depict the existence of mobile areas of high and low barometer. A succession of areas of high barometer is in control during warm dry years, and cold and wet years are usually associated with prevailing low pressure areas.

The question most frequently asked during the recent frost was, "Is the climate changing?" and the answer is graphically given in the chart of temperatures. Perusal of these comparative curves of temperatures during periods of 70 and 45 years will convince the most skeptical that there is no progressive change in climate. The record at San Diego, which began in 1852, is the longest in Southern

California and one of the few uninterrupted governmental series of observations in the country. Charted with the San Diego record is the shorter record of Los Angeles; these lines show two important facts:

First, that the weather at San Diego or Los Angeles is not becoming warmer or cooler with the progress of the years.

Second, that temperature changes are general over Southern California, which fact is proved by the regularity of the differences between the temperatures at Los Angeles and San Diego.

Is it possible to predict frosts or other weather conditions a season, a month or a week in advance? Meteorologists answer in the negative. Weather depends upon a great number of very aptly termed "variable

factors," the most important of which is the irregular changes in the so called "solar constant." This now is being studied at Mount Wilson and other astronomical observatories throughout the world. It must be remembered that meteorology is one of the youngest of sciences, less than a century old, and we await some Newton to discover the great fundamental law which may bear the same relationship to weather conditions that the law of gravitation bears to astronomy. Meteorologists are agreed that there is insufficient evidence to support any relationship between sun spots and weather or the motions of the planets or the existence of periodicity or weather cycles.

Among precautionary measures which may be taken by the orchardists are the following:

First, proper selection of the regions to be devoted to citrus culture, realizing that local environment plays a most important part in temperature control. Second, individual preparedness. This was emphasized in an article by the writer in the Cultivator of last November: "The real preparedness for coming seasonal weather" (Continued on Page 223)

Agricultural News Notes of the Pacific Coast

Northern California

Sonoma County's farm bureau held its annual meeting and election on February 22.

Thirty farmers in the Roseville farm center of Placer County have just finished installing a telephone line.

Placer County orchardists are urging that the horticultural commissioner take charge of the fight against pear blight.

Yuba and Sutter Counties are discussing joining in the building of a new bridge over the Feather between Marysville and Yuba City.

Colusa County will probably hold a road bond election early in April. The good roads committee of the farm bureau is working for the issue.

The state highway commission has let contract for construction of 17 miles of highway between Forsythe Creek and Outlet Creek in Mendocino County.

R. B. Eason of the agricultural extension service has been in Shasta County this week giving demonstrations in the essentials of housing and feeding poultry.

Engineers gathering data on water resources of the state are now working out of Redding, Shasta County. They will next make survey of the Iron Canyon dam.

Many orchardists of the Coloma and Lotus districts in Eldorado County are trying out for the first time the long pruning method, following demonstrations by Dr. Whitten.

The Willets Farm Bureau is to build a community hall at Willets this summer. Wm. Clan is president. The Chamber of Commerce is cooperating with them in the matter.

A survey of the state to determine means of stamping out malaria has been undertaken by the state board of health in cooperation with the Rockefeller foundation of the International Health board.

Poultry Producers of Central California handled 662,606 cases of eggs in 1921, an increase of 44 per cent over 1920. Pool sales amounted to \$6,833,051, 1½ per cent less than the year before, because of lower prices.

Petitions have been approved by the supervisors for the formation of an irrigation district to cover 15,000 acres in the Fall River Valley of Shasta County. The district will include Glenburn, McArthur and Fall River Mills.

Three septic tanks have been built in different sections of Shasta County under supervision of H. L. Belton of the agricultural extension service. The plan is to build such a demonstration tank in each of the 15 centers in the county.

The California Beekeepers Association at its 33rd convention at Visalia elected Cary W. Hartman of Oakland president, Casper Hauser of Sacramento vice-president, and C. D. Stewart of Chico secretary-treasurer. Executive committee chosen: R. L. Watkins, Selma; Phil Strubel, San Francisco; J. A. Howard, Oakland.

Manager Tucker of the Almond Growers' Exchange has returned from the agricultural conference at Washington. He reports a general feeling among delegates in favor of a similar national gathering every year or biennially to work out agricultural problems and present the needs of agriculture to the government and the country.

Central California

Delano, Kern County, is shipping head lettuce. About 130 carloads will be sent out.

Farm center meetings in Kern County at Shafter, March 1; Arvin, 3; directors, Bakersfield, 4.

At Calwa, Fresno County, a \$150,000 addition to the ice plant for fruit cars has just been completed.

Plans are being worked out to consolidate the Bakersfield and Kern County libraries under administration of the county.

County Veterinarian Edwards of Tulare reports to the supervisors that there are no more cases of hog cholera within the county.

Breaks in the High Line irrigation canal near Turlock, caused by the heavy rains, put a section of the lowlands under 15 feet of water.

Contracts have been let for state highway construction in Santa Clara County between San Felipe and the eastern boundary of the county.

Petitions are being circulated for a project to store and distribute the waters of the Kern. Some opposition has developed in the Panama district.

About 1000 acres have been planted to peas around Waterford and Empire, Stanislaus County, on contract with the Pacific Pea Packing Company.

The Biola, Fresno County, fruit exchange refunded to members for 1920 crops \$7,873, more than double the amount for 1919. Sixty-two carloads of fruit were shipped in 1921.

Report of the Tulare Cooperative Poultry Association shows price of January eggs 35 cents compared with 48 cents last year. Total business for the month amounted to \$15,937.

Members of the Tri-City Citrus Club of Jasmine, Richgrove and Ducor are considering joining the farm bureau of Tulare County. There is talk of the farm bureau securing a citrus adviser.

The Western Citrus Honey Corporation has 25 men at work in its plant at Woodlake, Tulare County, preparing for the orange blossom season. It will have 4,000 stands of bees in the orange orchards.

Forest Supervisor Cunningham, whose headquarters are at Porterville, says that he expects the Sequoia national forest to be self supporting this year from power and grazing fees and camp fire permits.

The Tulare Cooperative Poultry Association reports last year's output far ahead of the previous year: four times as many baby chicks sent out, for one item. Also feed is but two-thirds of previous year's prices and the outlook is bright.

The executive committee of the proposed water storage district has issued pamphlet containing statement of the law and principal facts with which land owners should be familiar. These may be secured from W. F. Hume, secretary of the chamber of commerce at Los Banos, Merced County.

The Fresno chamber of commerce reports: California now has 35,000 acres of figs under cultivation, last year's crop exceeding one million dollars in return, according to A. E. Sunderland, secretary of the Peach and Fig Growers, Inc. The estimated value of the state's fig orchards is \$20,000,000.

Southern California

For the first time in years Lake Hemet is full and overflowing.

Saticoy, Ventura County, is hoping for location of a creamery there by a Tulare County concern.

The San Diego County farm bureau is backing plan to establish a free farmers market in San Diego.

Horticultural Commissioner Kellogg of Santa Barbara County has been re-appointed for another four year term.

Work will commence on the \$100,000 bridge over the Santa Ana at Riverside as soon as weather conditions permit.

The establishment of a deer park in the San Jacinto mountains is favored by the Riverside County farm bureau.

The regular meeting of the Elsinore farm center of San Diego County is held on the second Monday of each month.

The farm bureau centers of the Antelope Valley of Los Angeles County held a poultry show at Lancaster, January 27-28.

Ventura County will erect a vacuum fumigator at Santa Paula where all nursery stock entering county may be fumigated.

Imperial Valley lettuce growers are happy over present prices of their crop. February 15 prices were \$3.25-3.75 per crate.

The Duarte-Monrovia Exchange began picking navels February 15. About one-fourth of the crop in that district was shipped before the freeze.

Costa Mesa apple growers held their first annual meeting and election of officers February 14. Five hundred acres are represented in the association.

The Colorado River Commission met in El Centro, February 20, to discuss with irrigation experts a program of conservation and reclamation.

The rate raises recently ordered on electric lines by the state railroad commission are crystalizing sentiment in several sections in favor of publicly owned bus lines.

The Villa Park, Orange County, Orchards Association is planning expenditure of \$275,000 in construction of packing house with pre-cooling and pre-icing equipment.

At a special meeting of the sugar beet growers from Ventura, Los Angeles and Orange Counties, a resolution was passed urging the farm bureaus of these three counties to organize sugar beet growers departments.

Sugar beet growers of Southern California have asked the U. S. department of agriculture to undertake a special investigation of the principal insect pests of the beet which it is estimated each year exact a toll of millions of dollars.

District Agent Runge of the Southern Pacific announces the total cantaloup acreage for Imperial Valley for 1922 as 26,461, an increase of more than 4,000 acres over 1921, or 15 per cent. His estimate for Brawley is 6,734 acres.

The crystal test for frosted oranges has been given up by the state department of agriculture and the familiar "drying out" test will now be used by inspectors. This test was employed in 1919 and is the standard used by federal officials.

The Coast and General

The Pan-Pacific Commercial Congress will be held at Honolulu some time in June.

A farmer at Satsop, Washington, reports raising 18 tons of sunflower silage to the acre.

Mexico abolished on February 1 all passport restrictions on Americans entering that country.

A 10,000 acre irrigation project is proposed for the vicinity of Riverside, Okanogan County, Washington.

The recent agricultural conference at Washington unqualifiedly endorsed legislation authorizing cooperative marketing.

Work for the jobless in Sweden is to be provided by a special appropriation of \$21,000,000 to be expended on road work.

County Horticultural Commissioner Tanner of San Luis Obispo County is conducting a fight with carbon bisulphide against the squirrel pest.

A bill has been introduced in the New York legislature to consolidate some of the agricultural bureaus and eliminate others which have grown superfluous.

Phoenix, Arizona, is enjoying its new water system just completed at a cost of \$1,500,000. The supply comes from the Verde river through 30 miles of redwood pipe line.

Approximately 7,000,000 feet of timber was blown down and uprooted during the storm period on the upper Skagit, Sauk and Suiattle Rivers, according to word received at the office of the forestry service at Bellingham, Washington.

A Chehalis, Washington, judge has just rendered decision affirming binding power of the contract between the Lewis-Pacific Dairy Association and its members. The farmer against whom test suit was brought was delivering to other dealers.

A loan of \$100,000,000 by the government to the nation's farmers and revival of the United States Grain Corporation were recommended as agricultural relief measures by Benjamin C. Marsh, managing director of the Farmers National Council, testifying before the senate agricultural committee.

The public service commission of Nevada has recently issued an order requiring drivers of auto stages and trucks engaged in the transportation of passengers, explosives and inflammable liquids, to stop before crossing the tracks of any steam or electric interurban railroad and look in each direction for approaching trains.

The Whatcom County, Washington, Dairymen's Association in 1921 with 1,651 members, and 11,776 cows sold milk and butter to the value of \$1,053,111. Butter sold amounted to 2,220,668 pounds, the average price received being 40 3-5 cents. Powered milk to the amount of 1,295,141 pounds was sold. The average price paid for fat at the producer's door was 45 1-3 cents.

A cooperative marketing association has been incorporated by tobacco growers of Wisconsin, Indiana, Ohio, Kentucky, Tennessee, Virginia, West Virginia, North Carolina, South Carolina and Georgia. The form of organization is similar to that of the California fruit marketing associations, upon which plan it was modeled under direction of Aaron Sapiro of San Francisco.

White Yolo a New Grain Sorghum

By Professor G. W. Hendry, University Farm

THE chief objection to growing milo and Egyptian corn has been the high expense of harvesting. These crops have been so non-uniform in height, so goosenecked, and so heavily stooled that heading machinery could not be

stooled heavily and which do not stand more than four feet in height, may be cut with a rice or wheat binder and the entire bundles fed through the separator. This method has been used at Davis and was employed by the Sutter Basin Company, on some 1500

The problem of producing grain sorghums or Egyptian corn in California has been largely a question of devising more economical harvesting methods. These crops are more productive than Indian corn over large parts of the state and may be grown with less moisture supply. The state experiment station has been attacking the problem from the angle of breeding a variety more dwarf and uniform in growth and more easily harvested and implement manufacturers have been working from the angle of perfecting more efficient heading machines. On October 15 implement manufacturers met at Davis and tested various types of headers on various types of grain sorghums. Much intelligent discussion developed, new ideas were advanced, and as a result new types of machines are now being made, new varieties being distributed, and another step in agricultural advancement in California recorded. This article reviews the progress in this field to date.

used efficiently in harvesting them, and the common practice has been to pick the heads by hand. The high cost of this operation has deterred many from growing an otherwise productive and adapted crop. Many years of selection have given some improvement in the uniformity and dwarfness of milo but never enough to make it readily adapted to heading machinery, and the Egyptian corns, while heavy yielders, are still as irregular and as goosenecked as at the time of their introduction into California from Egypt in 1874. We have tried to grow the straight headed kafirs in California from the Middle West but have found them to require 160 days or more to ripen in this climate with its cool nights, and have consequently been obliged to discard them. Darso, hegaria, and spur feterita have been rejected for the same reason. Standard feterita is too tall, too hard to obtain a stand with and not productive enough. Milo was our best all round variety and the one recommended generally by the experiment station, but this has now been improved upon by White Yolo, a new hybrid bred and selected at Davis and bearing the name of the county in which it originated.

Yolo Easily Headed

Yolo ripens as early as milo and in yield tests at Davis for two seasons has yielded slightly more than milo. Its chief advantage over milo or other grain sorghum varieties however lies in the dwarf stature (4½ feet under average conditions), its uniformity of height, and its erect carriage of all of its heads. The 1921 crop of Yolo at Davis was easily and cheaply harvested with heading machinery. Three makes of headers were demonstrated on October 15 before a group of interested farmers and implement manufacturers and all worked satisfactorily. As a result of these tests a California manufacturer is preparing to put on the market next spring two machines, a one row and a two row header. This is an example of breeding a crop to fit the machine. No heading machine previously on the market has been able to operate satisfactorily on the non-uniform, goosenecked varieties in use, but a new type of nine foot header, made in California, which operates upon the principle of a stripper, has recently made its appearance and promises to solve the problem of machine heading irregular goosenecked grain sorghum varieties. White Yolo is as uniform in height as wheat or barley and the common grain header such as is used in the Salinas valley for barley and oats may be used to head it. Unfortunately no grain sorghum ever matures and becomes dry enough while standing on the stalk in the field to be cut and thrashed simultaneously with a combined harvester, and it will generally be necessary to first head, dry, and then thrash. There are always some green heads present, and the moisture in these is sufficient to cause heating of the other seed in the sack unless dried before thrashing.

Use of Binder

Light crops of milo, which have not

acres last season, but is possible only where the crop is light and poorly developed.

The one row corn binder is the machine generally used for harvesting (Continued on Page 208)

Field of White Yolo on University Farm at Davis. Field planted May 15 to 19. Land irrigated prior to planting, again on July 10. Yield of thrashed grain, 2,909 pounds per acre of recleaned grain, weighing 60.5 pounds per bushel, or 135 pounds per sack. Note uniform height, erect heads easily handled by header. Also see illustrations on cover page.

KIRKMAN NURSERIES

Established in California in 1888

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

Reservations are now being made for future deliveries.

We offer our services in undertaking the planting and care of commercial orchards on large scale.

EDITORIALETTES

"Handsome is that handsome
does" is illustrated on the cover. Cer-
tainly that sorghum grain is doing
handsomely. Fuller explanation of it
is given in Prof. Henry's article which
appears on fifth page. This new
sorghum grain, developed on the uni-
versity farm, has been named "White
Yolo." After reading the article turn
back to the lower of the photographs
on the cover and note the difference
in the two sorghums, White Yolo with
its uniformly erect heads, while at the
extreme right of the picture, grown
under equally favorable conditions, is
ordlary milo. It is badly lodged and
so uneven as to make harvesting with
a header an impossibility. With its
economical harvesting White Yolo is
also capable of producing nearly a
ton and a half of threshed grain per
acre.—Photos by Prof. Hendry.

Let us all keep in mind "Form
1040A" and "1040F." March 15 is the
limit and it is coming with wonderful
swiftness and our income tax return
should be in. Some are so fortunate
as to be able to make their return on
"1040," but in whichever class we are
let us not forget the "Ides of March."

WAKE UP

Unless the people of California
wake up there is danger that they
will lose a great heritage, that they
will be tricked out of it like Esau and
barter away their birthright for a
mess of pottage—and the pottage
which is offered to them is of such des-
perately thin consistency that it does
not have the flavor of even good water.
The hydroelectric power companies
wish control of the wonderful "white
coal" possibilities of California's

DESPISED HIS BIRTHRIGHT

And Jacob sold pottage: and Esau came from the field, and he was
faint: And Esau said to Jacob, feed me, I pray thee, with that same red
pottage; for I am faint: therefore was his name called Edom. And Jacob
said, Sell me this day thy birthright. And Esau said, Behold, I am at
the point to die: and what profit shall this birthright do to me? And
Jacob said, Swear to me this day; and he swore unto him: and he sold
his birthright unto Jacob. Then Jacob gave Esau bread and pottage of
lentiles; and he did eat and drink, and rose up, and went his way: thus
Esau despised his birthright.

mountains; further, they are going
to secure control of those possibilities
if it is within their power. The as-
tounding part of it is that they are
receiving aid and comfort at the hands
of those who should be stading for the
interests of the people. Some cham-
bers of commerce and many of the
newspapers representing rural com-
munities are advancing "reasons" for
votes against the California Water
and Power Act, the fate of which will
be decided by the voters at the next
general election in December. The im-
mensity of the wealth at stake is prob-
ably the cause of the bitter campaign
this early, and all too many of the
people seem ignorant of the fact that
their rights to this great wealth are
jeopardized. In their anxiety to se-
cure additional support hydroelectrics
are offering to those who will invest
interest returns nearly double what
the state may secure funds for to use
in development of its own resources.

Apparently many of these investors
covet a share of the wonderful wealth
which these companies are endeavor-
ing to secure possession of, and they
are putting up their money freely in
the hope that the people will be com-
pelled to purchase the power—which
they own—at prices which will justify
great return to the owner of stocks in
hydroelectric companies. This very
campaign of securing support of in-
vestors at the expense of the great
mass of the people should be sufficient
to startle the sleepers and prod the
believers in ownership of the peoples'
own by the people, which just at the
present time means fighting those who
are conducting the present campaign.

Users of hydroelectric power, wake
up! The Cultivator hopes to have
some "points" in early numbers.

One point which the "other fellow"
is giving to us through a central Cal-
ifornia paper is this:

"The power companies have at-
tacked the right of the irrigation dis-
tricts to store water for irrigation
purposes, and the new filing is made
for that purpose. Under the conten-
tion of the power company the dis-
tricts must make continuous use of
the water to hold it, and the new filing
will give the opportunity to test out
that contention."

All of which is only one of the first
steps in the big campaign to take the
people's property. It is not often that
we will see the mailed fist as in this
case for most of the campaign will be
conducted along a different line.

There was once a tribe of Indians
living on the banks of the Colorado.
They were contented and peaceful and
happy. For warmth and for cooking
they pulled from the swirling stream
driftwood which dried and served per-
fectly. Came one more civilized, and
with an idea of giving a higher civili-
zation to the savage, and he suggested
that hereafter he would take charge
of the division of the driftwood and
the natives would be permitted to re-
tain only one-half of the driftwood
drawn from the river. One is as-
tounded when he notes the number of
natives there still are along the banks
of California streams who are willing
and even anxious to receive from the
promoters a half of their own drift-
wood.

GEORGE HAROLD POWELL

G. Harold Powell is dead. He
died, as he had lived, in the midst of
intense activities. There was no stop-
ping to rest, no retiring from any of
the big things of life in which he had
engaged. He rendered service to his
country in scientific horticultural
work with the U. S. department of
agriculture, with Food Administrator
Hoover during the war, in the recent
agricultural conference at Washing-
ton and in many other conferences af-
fecting the welfare of the people. At
the Washington conference he was

United States and Canada, gives the
following condensation of his life his-
tory:

"Powell, George Harold, general
manag. Cal. Fruit-Growers Exchange,
Los Angeles, Cal. Hort. and ent., Del.
Exp. Sta., 1896-1901; asst. pom., U. S.
Dept. Agr., 1901-4; pom. in chg. fruit
transportation and storage invests.,
1904-9; asst. chief, Bur. Plant ind.,
1909-11; present position, 1911—;
chief div. perishable foods U. S. Food
Administration, 1917—. Del. from U.
S. to Inter. Assoc. of Refrigerating In-
dustries, Paris, 1908. Auth.: Coopera-
tion in Agriculture, 1913. b. Ghent,
N. Y., Feb. 8, 1872; s. Geo. T. and
Martha (Chace) P.; reared on farm;
m. Gertrude E. Clark, Jul. 1, 1896; c.

Funeral services, strictly private,
were held on Tuesday. Arrangements
are in the making for a public mem-
orial service which will give all coope-
rators, and especially citrus fruit
growers, opportunity to recognize the
great service rendered the fruit in-
dustry.

ORANGE SHOW RAIN

The state is getting another
drenching. It started in the north and
has gradually coasted down until it is
deluging the southern end of the
state. Producers are crying "enough"
and are wishing for an opportunity to
do some work. Even the citrus grow-
ers are anxious to begin picking,
which is impossible on soggy ground
and with soaked oranges.

The management of the National
Orange Show is looking at the leaden
clouds and reviewing history of past
orange shows and recalling the delu-
ge which visited the first one held a
dozen years ago.

But really the state is not worrying
greatly for a deluge is to be preferred
to a drouth.

The Orange Show

UT where the Colorado des-
ert once was the white man
came and planted dates. They
grew and bore abundantly.

The weather was not to the
man's liking, however, for it was in-
tensely hot. The heat filled the dates
with sugar. People liked them and
they sold at fabulous prices. Then
the grower boasted of the heat which
he had formerly excused. Another
great California valley where summer
prevailed was that of the San Joaquin.
It boasted of its heat and even made
virtue of the fact that in the moun-
tains along its eastern edge the snow-
fall was the greatest of any place in
America, and as a reason for the
boasting called attention to the fact
that the summer's sun and the win-
ter's snow banks brought together in
the vineyards of the valley resulted
in vast wealth because of the sugar
stored in the raisins. Following the
example of these growers, the grower
of the golden orange ceased apologiz-
ing for the weather which at times he
felt was unfriendly. When he saw
indications of mid-winter cold stalk-
ing through the orchards where the
citrus grows he said it is well and he
began to boast of the fact that of all
the places in the world where the
orange reaches greatest perfection in
flavor, in acid and in sugar, there is
none equal to that section where frost
danger is great. He pointed to tropi-
cal Brazil where none ever heard of
shiploads nor of 50,000 carloads of
oranges being shipped from that tropi-
cal country where the Washington
Navel orange originated. The islands
of the Caribbean, and in fact all other
places with tropical conditions, have
failed in producing the perfect orange.
But crowded up on the foothills of the
snow-clad mountains of California it
reaches perfection and wealth is in-
creased. So annually the growers of

the orange, the lemon, the lime, the
pomelo and the citron come together
with their products and make a show
national in scope and boast of the per-
fection of the orange. This year's ex-
hibition is the twelfth.

Several acres of Urbia Springs Park
were required to house the exhibits
and the attractions brought together.
There were three monster tents, the
central and larger being filled with
citrus fruits and citrus by-products,
the others with implements and equip-
ment used by orchardists and with
commercial exhibits. Perhaps one of
the most striking exhibits was that of
the by-products, a subject of particular
interest in a year like this. The prin-
cipal features of this exhibit were col-
umns six or eight feet high and nearly
a foot in diameter, made of monster
glass tubes filled with sliced citrus
fruits. There were by-products in the
form of confections, marmalades, jel-
lies, pies, cakes. There were oranges,
lemons, grapefruit and limes pre-
served. There were "straws" and
many other forms of candied and pre-
served peel, and nearly all of these
by-products were exhibited as the pro-
duct of the home kitchen. The Uni-
versity of California made its usual
exhibit of varieties, and here again
there were literally hundreds of dif-
ferent citrus fruits varying from the
tiny kumquat to the monster and
worthless Shaddock.

Newspaper people gathered on the
opening day and learned the lesson of
the citrus and commented on the ex-
cellence of the exhibit. All California
made greatest effort to bring of its
high quality fruit because of the sug-
gestion that had been given out after
the cold spell that a citrus exhibit this
year would be impossible. So when
the fruits came together it was found
that the judges had no light task in de-
ciding as to its superiority. It was
fine in appearance, it was fine in
quality.

And none of the exhibits was grown
in the tropics.

Bulk Grain Storage

CALIFORNIA is in the midst of a radical change, agriculturally. A gradual transformation from the wasteful method of handling grain in sacks to the system of up-to-date machinery and bulk handling is at present going on.

The start was made some 12 months ago, and while much opposition to the movement has been incurred from the various industries interested in the sack, progress is well under way for the present campaign which will put the finishing touches on last year's work.

Farm Storage the Primary Need

It was proven by last year's experience that instead of the necessity for country elevators being constructed first, the real necessity was for farm storage and that the need for the elevators naturally follows.

The reason for this is that the elevator, which would naturally hold but a very small percentage of the grain in a certain locality, should be operated for cleaning, mixing and loading of grain on cars and not be filled with grain at the early run of harvest, thereby blocking the very purpose for which the plant was built. If the country elevators were kept open so that a free flow of grain could be taken in, and the various qualities kept separate in bins reserved for them, then blended and loaded on cars, the elevators would be busy the year around, even in localities where the change from sack to bulk handling had not been completely accomplished. So operated, the elevator could earn adequate returns on the investment. Therefore it may be seen that the first logical requirement is some sort of storage the other side of the country elevator—that is, on the farm. From such storage the grain may be fed into the elevator as the market requires it. Then and then only is the bulk handling problem solved.

Savings Pay Cost

Figures taken from last year's experience prove that from 15 to 20 cents per sack was saved by bulk handling from the harvest field to aboard the cars. On the basis of this year's prices of labor and materials, the savings per sack reasonably to be expected from the adoption of bulk handling are about as follows:

Loss Eliminated by Bulk Handling

Cost of sacks, 7 cents; twine, 1/2 cent; storage, 7 1/2 cents; insurance, 1 1/2 cents; waste and spillage, ratage, etc., 4 cents; labor and material, repairing broken sacks, 1 cent; labor handling sacks, 2 cents. Total 23 1/2 cents.

Metal grain bins in the larger sizes cost approximately 20 cents per sack or about \$500 for one that will hold 2,700 sacks of grain. The bins are the principal item of expense in changing from sack to bulk handling; so it is evident that the savings on one or two harvests will be sufficient to pay all the costs of the change.

Avoiding the Harvest Rush

With the grain stored on the farm the grower will get away from the forced haul at harvest time (which in many instances is a long one) and may haul at his convenience later on. Men and teams may be spared for such work much more easily in October or November than in June.

Holding for Favorable Markets

At times the highest price being paid for barley may be in the middle west where they want the grain in bulk, or it may be sold in bulk for export to be shipped from San Francisco, and consequently shipments in bulk will be in order. Should these prices be out of line, and the highest prices obtainable in the poultry districts of Northern California or near Los Angeles, then shipments may be made in those directions. Some of the large dealers in the poultry districts buy their grain in bulk; but if sacking is required, it can be accomplished much more cheaply at the storage bin than in the field.

The prevailing daily market on all grains continually changes in the different market localities. Consequently if the grower will get in touch with other buyers than the one local buyer at his home station, and be

able to ship his grain either in bulk or in sacks, and when dealers or millers are most anxious to buy,

able at tidewater will be very useful in connection with grain that is to be exported. If, however, it turns out that better prices are to be had in the local or middle west markets, the farmer is much better off if the grain is still on his own premises, since

half way last year did not fare well; that is, those who sacked their grain, then hauled it to elevators and dumped their sacks did not achieve the big end of the saving; but the growers who went at the proposition in a full, confident way obtained more than they expected.

"Those Who Came to Scoff"

The logic of actual events has converted many doubters and scoffers into whole-hearted boosters. Some of the local warehousemen who were strongest in opposing the bulk movement last year, claiming that there would be no market for bulk grain, have themselves been the best buyers of bulk grain in their localities, and at the best prices. And quite a number of farmers have realized for the first time that there is really no need for the grain harvesting season being a time of tugging, sweating and swearing, since it can all be accomplished by machinery, regardless of the height of the thermometer, and with no one lifting anything heavier than a gallon oil can.

Delivering the Bulk Grain Direct to the Wagon
Scene on the Kilkeney Ranch, where the big combine is delivering the grain direct to wagon.

these seemingly small differences will net him several cents per sack more than he has usually received.

Terminal Elevators Essential
The terminal elevators now avail-

he can ship it out at any time in sacks or in bulk, and in any direction, subject to only one freight charge.

WATCH, CHAIN AND RING—all three articles sent without cost to boys and girls selling only 50 pkgs. assorted flower and vegetable seeds at 10c a pkg. We trust you — send no money, just postal with your name and address. Seeds easy to soil, many take a dozen packages. Choice of many other useful gifts if desired. **KEENEY SEED CO.** Box 714 Monongahela, Pa.

RICHARD DIENER CO., INC.

Kentfield, Marin County, Cal.

GLADIOLI

DIENER'S HYBRID GLADIOLUS

Petunias, Diener's Ruffled Monsters (Single)

The most perfect and most beautiful Petunias in existence. They have taken the highest prizes wherever shown.

Seed in separate colors: Red, Pink, Variegated, White, Flesh Pink Frilled, Blue and Mixed.
Price, per package 50c

The DIENER TOMATO

30-40 tons of tomatoes to the acre. Most perfect tomato ever raised. Flesh is of a deep red color; it is free of the acid taste. THE DIENER TOMATO is drought as well as blight-resisting.

Price—Sample pkg., 25c; one-quarter of an acre pkg., 50c; per acre pkg., \$1.50.

Originators and Growers of the Largest and Finest Gladioli in the World.

You can't get any plants more profuse in worthwhile bloom, nor can you find any flowers superior for cutting. Spikes placed in water will bloom for weeks at a time; those in the garden will flourish over a long period. To acquaint you with some of our varieties, we make the following Special Offer:

A collection of 12 of our world famous named varieties (our own selection)\$1.50

GLADIOLUS Bulb. Doz.
"CAPTAIN ASHER CARTER BAKER"—Rich, velvety red with darker center; flowers 5 inches in diameter, spikes 4 to 5 feet high. (This was awarded the silver medal at the P. P. I. E., 1915, for the best of all the red Gladioli shown)\$.05 \$.50

GLADIOLUS
THOS. T. KENT—Rose-pink, with ruby running through center of each petal; very vigorous in growth. This is one of our largest varieties, one of the heaviest propagators. Flowers 6 to 8 inches in diameter, spikes 6 feet..... .25 2.50

GLADIOLUS
JACK LONDON—Light salmon with brilliant orange flame stripes; golden yellow throat with ruby striped center; flower 5 inches in diameter, spikes 5 to 6 feet. Exceptionally fine 50 5.00

GLADIOLUS
MRS. H. E. BOTHIN—Flesh-salmon pink, flame-scarlet center; large size, strong 4 to 5 foot spikes; a first-class show variety 50 5.00

GLADIOLUS
FRANK J. SYMMES—Salmon-rose pink with red center, ruffled edges; flowers 4 inches in diameter; spikes 5 to 6 feet high 25 2.50

DIENER'S HYBRID GLADIOLUS MIXED

This mixture contains all colors of the rainbow. Many of them are heavily ruffled and of very large size. There is hardly two alike. The most wonderful Gladiolus Mixture ever sent out. All of our own creation. We sell this Mixture in three grades. All are guaranteed to flower this summer. Prices:

Grade No. 1 Bulbs, \$2.00 per dozen
Grade No. 2 Bulbs, \$1.00 per dozen
Grade No. 3 Bulbs, 50c per dozen

Entomology in China

We have referred to the fact that Prof. C. W. Woodworth, for many years connected with the University of California as entomologist, has taken up entomological work in China. We now have from Fu Huan Quong, secretary of the college of agriculture and bureau of entomology of National Southeastern University, Nanking, China, a letter in which he says:

"Enclosed please find the accompanied article: 'Prof. C. W. Woodworth becomes the director of the Bureau of Entomology, Kiangsu Province, China, with his inaugural speech,' and under separate cover I am sending you a photograph taken at the close of the ceremony. This is one of the most important facts toward the progress of Chinese agriculture and the news will have special interests to Americans because it relates to the coming of Prof. C. W. Woodworth to be the director and chief entomologist of Bureau of Entomology, Kiangsu Province, China, which

is newly established. We wish you will publish the same in front columns of your magazine as soon as you receive it, and we shall be very glad to supply you further information concerning the progress of the new bureau.

Secretary Quong adds: "Prof. C. W. Woodworth was invested with the office of director and chief entomologist of Bureau of Entomology, Kiangsu Province, China, on January 14, 1922, at a simple but most impressive ceremony in the Flowering Hall at Bureau of Industry, Nanking. The military and civil governors, the commissioners of industry, finance and education, educators and scientists of Nanking institutions and delegates sent from different districts of Kiangsu Province attended the inaugural ceremony.

"The exercises opened with music by the police band. Then the Com-

missioner of Industry reported the organization of this new bureau and the military and civil governors made short addresses. Prof. C. W. Woodworth delivered his inaugural speech, which was interpreted into Chinese by Prof. H. H. Hu, of the National Southeastern University. P. W. Tsou, dean of the college of agriculture of the above mentioned university, who initiated the organization of this bureau, and D. S. Chang, representative of Kiangsu Provincial Assembly, also gave short addresses. The exercise closed with a picture taken and a tea party.

"The speakers generally emphasized the urgent necessity for the establishment of the bureau of entomology and appreciated the kind response of Prof. C. W. Woodworth, who willingly accepted the new position. They all believed that Prof. Woodworth, with his profound experience on the line of entomology and his ardent interest in the welfare of Chinese farmers, will accomplish what he has done in the state of California.

"With the present organization as a foundation, the bureau will in the

near future be enlarged into a national one, having a branch in each province, for the Chinese realized that such step will reduce insects' damage to farm crops and eventually is a money saving policy. The present bureau is supported by the Kiangsu Provincial government, the Fong Tai reclamation companies and the bankers who issued loans for the above companies. It is located in one of the experimental stations, College of Agriculture, Southeastern University, Nanking. Prof. Geog. Park Jung, appointed as provincial entomologist, is now helping Prof. Woodworth to carry out his plans. Messrs. C. Francis Wu and H. S. Chang, graduate students at Cornell and California Universities, respectively, are invited by the bureau as entomologists, and they will return to China to assume their office after June."

SPRAY RESIDUE ON PEARS CAN BE AVOIDED

Growers of Bartlett pears have been troubled with arsenical spray residue on fruit shipped East during the past few years. Following the investigations by A. J. Ackerman of the federal bureau of entomology and conducted cooperatively with the California department of agriculture, recommendations have been made as follows:

The codling moth can be controlled and arsenical spray residues avoided by proper and thorough spray methods. Arsenate of lead should be used at the recommended strength of two pounds of paste or one pound powder to 50 gallons. Thoroughness of application, good equipment and high pressure are very important. Efforts should be directed toward thorough control of the codling moth in the early sprays to eliminate the possibility of infestation late in the season and the consequent very late applications.

In pear orchards where the codling moth is not a serious problem three or four spray applications are sufficient. These sprays should consist of a calyx application, a second spray three to four weeks later applied before the earliest worms hatch, a third spray two to three weeks following the second just previous to the hatching of first brood worms in large numbers, and a fourth spray, whenever necessary, to be made about two to three weeks before the first picking of pears for protection against late worms. In orchards where the codling moth causes much damage it is advisable to apply a second calyx spray 7 to 10 days after the first one, making a total of two calyx sprays and three cover sprays.

To reduce to a minimum amount of spray residue on pears, coarse drenching sprays should be avoided. This can be accomplished by the use of nozzles with disk openings of about 1/32 inch for the cover sprays. With the fine mist sprays the particles of spray material are distributed uniformly as tiny spots over the fruit. Such a spray serves as a splendid protection against worms and at the same time it permits for weathering of the spray residue more rapidly than would result from a coarse spray. Even with the fine mist it is essential that the last cover spray be finished not later than two or three weeks before the first picking.

WHITE YOLO A NEW GRAIN SORGHUM

(Continued from Page 205)

tall growing varieties such as feteria, shaliu (Egyptian wheat), kaoliang, honey sorghum, orange sorghum and standard milo. These crops are too tall to head by either hand or machine and too bulky to handle with the rice binder. The old method was to bind with the corn binder, and shock to dry before thrashing. The heads were then cut from the bundles by hand and thrashed separately. Recently an eastern manufacturer has improved upon this process by putting out a kafir corn topping attachment for a separator, which is attached to the side of the thrasher in such a way that the bundles may be headed and the heads carried into the machine by simply holding the bundles up to the circular

Delivered in California

*Unbeatable for
Orchard work*

Hard this way,
but—

Easy on a track—
The Cletrac Way

The "impossible" has been done! A tractor that is unbeatable for orchard work in addition to handling all other farm jobs, including all kinds of cultivating, has been developed!

With a complete range of usefulness for all farm work—with a price that is right in line with the demand of the hour—Cletrac F will actually make you figure the use of tractor power all over again.

Cletrac F does all your orchard plowing and cultivating, using the tools that you have on hand at present. It is low set and compact—works right up close to the trees without scraping bark or branches. Its remarkable short-turn ability allows it to swing from one row into the next with a single twist of the wheel. In addition—Cletrac F does all the regular farm jobs outside the orchard, including row-crop cultivation.

Its capacity for work is enormous—plows 6 to 8 acres a day—discs 15 to 20—harrows 20 to 25—and withal it is so simple, care-free and accessible. Equipped with a sturdy, powerful 4-cylinder kerosene, distillate or gasoline burning motor.

See your local Cletrac dealer or write our nearest office for full information.

THE CLEVELAND TRACTOR CO.

"Largest Producers of Tank-Type Tractors in the World"

19077 Euclid Ave., Cleveland

PACIFIC COAST FACTORY BRANCHES

LOS ANGELES, CAL. SAN FRANCISCO, CAL. SPOKANE, WASH.

1. Handles every farm job.
2. Plows 6 to 8 acres a day using any 2-bottom 12-inch plow.
3. Every part subject to wear constructed of chromesteel—weighs only 1820 lbs.
4. Automatically lubricated—no grease or oil cups.
5. Simple, care-free design—burns kerosene, distillate or gasoline.
6. Every working part quickly accessible.
7. Unprecedented value at \$875 complete.

Model "F" Cletrac is made in four sizes: 31 inches wide, with 8 inch clearance; 41 inches wide, with either 8, 14, or 18 inch clearance.

Plant for Profit

Coates No. 1403 and
No. 1414 Prunes

Very heavy bearers. Fruit graded mostly in 40/50 and 50/60 class. Good growers, dry well. We have some extra fine one year, branched trees for immediate delivery on peach root. Suitable for all soils except extremes of wet and dry. Write for catalog.

Leonard Coates Nursery Co.
Morganhill, Cal.

HUBAM

Get a start with Hubam, the marvelous annual White Sweet Clover, greatest money-making crop known. Sure growth, heavy yield. Grows as high as six feet. Wisconsin farmer got \$4200 from five-acre crop. Seed yield brings \$75 to \$300 per acre. Makes excellent Bee pasture. We have only a limited amount of 99% per cent pure Hubam at only \$1.40 per pound. State certified seed. Order from this ad or write for money-saving price list. Full instructions for growing Hubam with every order. Don't wait. We pay the freight.

saw cutting device. One of these machines has been loaned to the university farm and will be demonstrated next season together with several other new sorghum heading devices.

The introduction of Yolo it is thought has simplified the harvesting problem considerably and given the farmer a summer grain crop which may be cheaply harvested with any type of header. Already enough seed has been spoken for to plant 5,000 acres and much more will doubtless be planted. One company alone has purchased seed for 1,500 acres next season, and samples have been sent for test to all other state and federal experiment stations where sorghum is grown.

Yield Tests

It is yet too early to form an opinion as to how Yolo will compare with milo in yield under all conditions, but in two years field tests at Davis it has been slightly more productive. In 1920 White Yolo yielded 3,062 pounds of cleaned seed per acre and an adjoining check of a selected strain of dwarf milo yielded 2,837 pounds per acre. In 1921 our best field of Yolo yielded 3,397 pounds per acre and our best milo field 3,289 pounds per acre.

To compare Yolo and milo as to drouth resistance a winter plowed field was divided into two equal parts and half planted to Yolo and half to milo on the same day, April 22, 1921, and the two crops allowed to mature without irrigation. Both suffered from drouth but milo yielded 1,506 pounds of seed per acre and Yolo 2,016 pounds per acre. Milo stood more and exhausted the limited supply of soil moisture in producing a large leaf growth. Yolo stood less and was able to remain green longer and produce more well filled heads.

A few small lots of seed for demonstration plantings were sent out last season (1921), and the reports which have come to us tend to confirm the findings at Davis.

B. S. Cole of Hanford reports that Yolo yielded 25 per cent higher than milo.

Alton Sailors of Poplar, Tulare County, grew Yolo and milo under the direction of W. E. Gilfillan, assistant county agent, and reported Yolo to yield 6,323 pounds per acre and dwarf milo to yield 5,614 pounds per acre.

E. G. Case of Poplar also grew Yolo and milo as a demonstration under Mr. Gilfillan and reports Yolo to have yielded 5,789 pounds per acre and milo 3,900 pounds per acre.

B. Grogan of Ripon writes, "I planted nine rows of Gyp corn, 12 rows of Morse's white milo, and seven rows of White Yolo, side by side and all of equal length on June 1, 1921, no irrigations and one cultivation given. Gyp corn ripened three weeks ahead of the others, but I kept no account of the yield as I could see the others would outyield it. Twelve rows of white milo yielded 650 pounds of heads and seven rows of White Yolo yielded 750 pounds of heads."

A. R. Waybur of the Sutter Basin Company, Grafton, writes under date of December 19: "I beg to state that you sent us sufficient seed for two acres. We thrashed these two acres December 16, 1921, with a Russell rice thrashing machine. The corn had previously been cut and bound with regular rice binders and the bundles stood up in shocks to cure. This method of course meant that we knocked off a good many heads which were not harvested. The two acres, however, yielded 5,940 pounds, or 2,970 pounds per acre. 245 acres of our best dwarf milo yielded 1,740 pounds per acre. Grain harvested out of shocks with about 700 pounds left on the ground, heads knocked off by reels, etc., which we are now gathering and thrashing to make a second grade, will give us approximately 2,440 pounds per acre. We like Yolo much better than the other varieties. It doesn't shatter out so badly; it is easier to harvest and brings more money than red."

J. W. Adriance, county agent for San Joaquin County, conducted a test with five varieties in the Ripon district with the following result: Dwarf milo, 3,675 pounds per acre; White Yolo, 3,571; white Gyp, 1873; white milo, 1,633; feterita, 1,429.

"The white Egyptian corn was the earliest maturing, followed by Yolo about 14 days later, and the other milos and feterita took about one week longer than Yolo."

To win a race a Jockey doesn't put extra weight on the horse that helps him succeed

No man or woman who wants to succeed in the race of life can afford the handicap of headaches, insomnia, indigestion and debility. Nor can they afford to take anything that may keep up a continual irritation of the nervous system.

Yet this is what many people do who drink excessive amounts of tea or coffee. For tea and coffee contain caffeine, a substance that is sometimes very injurious. Many doctors say that caffeine raises the blood pressure, irritates the kidneys and over-stimulates the entire nervous system. Also that it is especially bad for growing children, or for any one who has any tendency to nervousness or insomnia.

If you want to avoid a possible cause of headache, insomnia, or nervousness, it might be well to stop taking tea and coffee for awhile, and drink rich, satisfying Postum, instead.

Postum is a delicately-roasted, pure cereal beverage—delicious and wholesome.

Order Postum from your grocer today. Drink this fragrant, healthful beverage for awhile, and see if you will not feel brighter, more active, and more resistant to fatigue—as so many thousands of others have felt.

Postum comes in two forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes.

Postum for Health

"There's a Reason"

TYPICAL OF GOODYEAR VALUE

Buyers of Goodyear Tires today are in an enviable position. Their money buys more in tire quality and tire mileage now than ever before.

The first reason for this is the improved design and construction of Goodyear Tires.

The second is their present low prices—the lowest in the history of the company.

Typical of Goodyear values now is the popular 30 x 3½ Goodyear Cross Rib clincher, illustrated above with its companion, the famous 30 x 3½ Goodyear All-Weather Tread. More than 5,000,000 of these Goodyear Cross Rib Tires have been sold in the past five years.

Built of the same high grade Egyptian cotton fabric that goes into the All-Weather Tread Goodyear, with a long-wearing but differently designed tread, they have given remarkable service.

The exceptional value afforded in them is proving to thousands of car owners the folly of buying unknown and unguaranteed tires.

You can get these tires from your nearest Goodyear Service Station Dealer. Ask him to explain their advantages.

GOODYEAR

Why A & M Seeds Are Reliable

Because A & M Seeds are tested in our trial grounds and proved of highest germination, purity and dependability. All seeds are tested to find those varieties best suited to our peculiar climatic and soil conditions.

You're Sure

You're sure of large and profitable crops of delicious vegetables when you plant A & M Reliable Seeds. Plant now A & M Early White Rose Seed Potatoes; A & M Extra Early Adams or A & M Oregon Evergreen Sweet Corn; A & M Indiana, Tiptop or Burrell Gem Muskmelons; A & M Klondike or Chilean Watermelons; A & M Stringless Green Pod or A & M Superior Kentucky Wonder Beans.

The dealer who sells you A & M Reliable Seeds has your interest at heart. You can depend upon his seeds. Find the A & M dealer in your neighborhood. Insist upon A & M Reliable Seeds.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Location of Pump

Will a pump do better work near the surface of the water than ten or 12 feet above, running the same speed at both places with water to be lifted 25 feet? Is it possible to run a centrifugal pump with a four cylinder automobile engine directly connected and not use any more fuel than a stationary belt drive of single cylinder?—Subscriber, Boonville.

If there is no variation in the level of the water from which the stream is being pumped, and the pipes are large enough to give a free flow, the pump will discharge the same amount of water whether it is placed under the water or within ten to 12 feet above the water. This is of course assuming that the water does not lower in the body from which it is being pumped and that the speed of the pump is constant. To get the best results a centrifugal pump should be run at an unvarying speed which is determined by the diameter of the runner and the height to which the water is to be raised. Automobile engines are not made for that purpose and if used for pumping would have to be fitted with a governor. An engine directly connected with the pump is not likely to give the satisfaction that a belt connection will give nor do as well as a direct connected electric motor. If there is a seasonal variation of height of the water surface belt connection will be the best at all times, as it allows change of sizes of pulleys to make the proper speed for the distance the water has to be raised. In actual practice the multiple cylinder engine is likely to use more fuel than the single cylinder.—J. B. N.

Rhizoctonia

It is said here that melilotus indica and sweet clover used as a winter cover crop "carry" the disease rhizoctonia and that oats, barley, rye, etc., do not "carry" it. Please inform me through your columns.—Subscriber, Van Nuys.

None of them "carry" this fungus. Under favorable conditions it may be developed in almost any soil.

Poisonous Parsnips

Do parsnips ever get poisonous? I have somewhere heard or read that they did after taking their second growth, and would like to know.—Subscriber, Lindsay.

The garden parsnip does not become poisonous. In its original wild state it was (and is) mostly leaves and little root, and the latter is somewhat poisonous. There is probably no danger in any garden escape or "hold over" of the garden variety.

Ailing Almond

I am sending branch of almond covered with scale. What causes it and what is the remedy?—Subscriber, Watts.

The piece of wood sent has been dead for some time. It contained no scale and there are no evidences of its having had scale. It has, however, evidently been badly affected with red spider during the past summer. A 2½ per cent solution of commercial lime-sulphur has been used with good results. The addition of four gallons of flour paste to the hundred gallons has made this spray more efficient through causing it to spread more evenly. The Los Angeles County horticultural commission reports the best success from using a spray of ten pounds of atomic sulphur to 100 gallons of water.

Seeding Sugar Beets

Will you tell me if sugar beets would go to seed if they were planted in September and let grow till next fall in an irrigated country, and what tonnage should be gotten to the acre and if they would be profitable feed crop for hogs and cattle.—Subscriber, Beaumont.

Sugar beets would probably not go

to seed under the conditions you mention. The beet is a biennial. It makes its root growth the first year and flowers and seeds the second year. It needs all of the first summer to mature the root and will not seed until root has been first matured. In cold countries beets are taken up in fall and roots for flowering and seed re-set in spring. In California they may be left in soil over rainy season or so-called winter. The crop tonnage is extremely variable, it all depends on soil and care given, the latter mainly dependent on irrigation. Beets are a profitable stock crop where conditions are favorable.

Starting in Rabbits

I am a boy 12 years old and I am going to get some rabbits. Will you give me full instructions on their care? What kind of houses should they have? Is it better to have a run for them? What kind of feed and

Alfalfa Seed Growers
Association
ARIZONA—CALIFORNIA

how much should I feed them? I am hoping to get an early answer.—Frank Robbins, San Gabriel.

We have in hand an article written by W. D. White, a long time rabbit grower. If it is not in the present week's issue it will be within a very short time. Meantime we would advise Frank to visit as many rabbit producers as possible and see their hutches and learn from them their methods of handling. Many very successful producers are producing rabbits without any runways whatever. We may also suggest that many helpful hints may be had from the "Rabbitt Book—Belgian Hares, Flemish Giants and Others," by F. L. Washburn and published by the J. B. Lippincott Co., Philadelphia, at \$2. It is a 200 page book giving much information about rabbits.

FARM BUREAU

Plans for a vast extension of the bulk handling of grain in California, especially in the San Joaquin, Sacramento and Salinas Valleys, are being worked out and put into practical operation by the California Farm Bureau Elevator Corporation, according to Secretary Heileman.

This is the second season that the bulk handling method has been in operation generally. The present plan is to construct from five to seven new elevators at various points throughout the three valleys and in other parts of the state. At the present time Heileman, A. E. Lindstrom, president of the Farm Bureau Corporation, and an assistant are in the field doing organization work preparatory to the building of elevators.

One of the principal advantages of bulk handling and the storage of grain in metal bins is the prevention of loss from torn, gnawed or broken sacks. This metal grain bin storage not only permits of holding the crop until market and shipping conditions are favorable but protects the grain against attack by rats and mice and destruction by fire. Other advantages of storage on the farm, as stated by grain growers, are the saving in fire insurance and the protection of grain from dampness.

FREEZING POINT FOR VEGETABLES AND FRUITS

The freezing points of a large variety of vegetables and fruits, which are likely to be subjected to freezing condition during harvesting, handling, or marketing, have been the object of special studies in the bureau of plant industry of the United States department of agriculture. Between 15,000 and 20,000 determinations have been made, including the freezing points of 25 varieties of apples, 22 kinds of strawberries, 18 varieties of potatoes, 19 different types of sweet potatoes, 19 tomato varieties, and many varieties of cherries, grapes, peaches, plums, blackberries, raspberries, cranberries, and some cut flowers, particularly peonies, roses, and lilies. Besides this general study, the work is being continued with the principal fruits and vegetables which are liable to be in danger of freezing either in transit or on the market. In this work the methods of detecting freezing injury, the rate at which fruits or vegetables freeze in constant low temperatures are determined.

The freezing points were determined for 18 standard varieties of Irish potatoes, grown under the same cultural conditions, harvested at the same time, and stored at the same temperatures. The freezing point apparently varies with the variety and shows a tendency to vary with the family group. It has been shown that potatoes can frequently be exposed to temperatures much below their freezing points if they are not disturbed until the temperature is again above the freezing point. This is an important consideration to potato growers and handlers.

PROBABLE NEW LEADER OF BLOC

Senator Capper of Kansas is being mentioned as leader of the agricultural bloc in congress to succeed Senator Kenyon, who was removed from active work by acceptance of an appointive office from Pres. Harding. Senator Capper is said to be the general choice of both Republican and Democratic members of the bloc.

EXPERIENCE

I've lived through forty kindly years—
I've been a little boy at play,
My mother used to dry my tears
And kiss my little hurts away;
I've trudged to school against my will,
I've wondered why I had to go,
I've been through many a childish ill,
All boyhood's joys and cares I know.

I've been the dreamy, sallow youth
Who thinks himself so very wise;
Once on a time, to tell the truth,
I placed much stock in fancy ties
And pointed shoes and yellow spats,
For I was only twenty then.
But now I've but one regret, and that's
The way I sneered at older men.

I've been impatient to succeed,
I've dreamed my dreams, and some in vain,
I've pictured many a splendid deed
By which my goal I should attain;
I've played the sighing lover, too,
I've stood to grief and suffered woe,
All that a man must journey through
At some time has been mine to know.

And this I've learned, that one and all
Follow the common path of life,
We share its game as children small,
And later share the days of strife,
Now, looking backwards, I can see
That much I rallied against was good,
When time had made it plain to me
And what seemed harsh, I understood.
Edgar A. Guest.

HER AUNT MARGARET

(Continued from last week.)

Alice's heart went out to the wearer of the pink rose. It was going to be delightful to have such a cousin. That must be what she was, of course. She was probably one of the uncle's daughters. Alice felt just a bit shy about asking. The girl had taken for granted that she would know who Peggy was. Probably they hadn't understood here in the East about mother's ways, and loyalty closed Alice's lips. From the conversation she would surely be able to pick up enough facts to carry her through without awkwardness. Presently she would inquire about Aunt Margaret, unless Peggy spoke of her.

Peggy chattered of everything else. "We'll have lunch first before we go home. You must be starved. Have you ever—But of course not! You've never been in Boston before. Oh, I hope you'll like it!"

"I'm sure I shall. I like it already." "That's good. Do you mind my saying how relieved I am to see you? I was afraid you might be—well, dreadfully superior, you know."

"Superior?" "And fearfully intellectual." Alice laughed. "Oh, I see! You think that because mother wrote books that aren't fiction. I'm not a bit like mother."

"I try to read her books," confessed Peggy, "but I never make much headway. I haven't a notion what she's talking about."

Alice nodded. "I never knew," she said simply. "Mother was terribly brilliant. Brainy people always admired her. I'm not a bit that way."

"You suit me just as you are. You don't mind my saying so, do you?"

"I like it." It was very odd that Peggy didn't speak of Aunt Margaret. The puzzle teased Alice's brain as the two girls chatted over their salad and rolls, and incidentally took stock of each other.

"There's another place where they have better ice cream," said Peggy. "Don't you like a progressive meal?"

It was at the other place, a candy shop, where Alice made her discovery. She thought she would buy a box of candy to take to Aunt Margaret. But when she put her hand into her silver mesh bag for her purse, it wasn't there.

"My purse is gone." Peggy was very much excited. She had to look at the bag and think back along the way they had come, and her conclusions were immediate.

"Some one took it in that crowd we pushed through on the last corner, slipped the bag open and stole it."

"But how could anyone?" "They jostled you. I've heard it is done that way. Did you have much money in it?"

"Only a few dollars. The rest"—"Yes, I know—stuffed away somewhere inside."

Alice didn't answer, for just then she had an uncomfortable thought. What did she really know about this girl who called herself Peggy? True, the girl wore a blue suit and a pink rose, but that might have been an accident. But she hadn't given her

self any last name, or called her companion anything at all, and it was very suspicious that she hadn't mentioned Aunt Margaret. Suspicion was preposterous, yet wasn't that exactly the way things happened in books?

The thought, once in Alice's head, refused to leave it. Reason couldn't banish it. Something was wrong.

This girl had mentioned mother, hadn't she? But that, Alice remembered now, was only after Alice herself had fairly put mother into her mouth. Peggy might be a thief; though she certainly did not look like a thief. The boldest crooks never did.

Deliberately Alice came to a momentous decision. In fact, it was not so much a decision as a discovery. She discovered that she could not do without Peggy. Whatever Peggy was, thief or no thief, Alice must keep her. She had lost her heart to Peggy.

"Never mind, Peggy," she said. "It's gone. Let's not bother."

Peggy's eyes shone. "You're a sport," she declared. "Oh, I like you!"

"Do you?" Alice flushed with happiness.

"I was so afraid," Peggy confessed; "that I might not, and you don't know what a tremendous load is off my mind to find you as you are. The whole thing is so weird. Don't you think so?"

"Very." Alice was mystified.

Peggy laughed heartily. "My dear, when I told the girls, I thought they'd die. Every time I meet Jane Somers—you'll like Jane Somers—she has something to say about it. But when they actually see you, I don't know what they will say."

Something cold gripped Alice's heart. Her lips stammered. "But why?"

"You're so tall and so statuesque and so grown up," chattered Peggy, "and I—I'm so little."

"I wish I were little. I always did. You—you're too cute for words."

"There, you've said it—'cute'! Jane will perish when she hears this! And I don't suppose the boys will ever let us alone. I hope you don't mind being teased, for there's so much of it done in our family."

Alice's dismay deepened. Peggy had met the wrong person. The room swam giddily; a great loneliness engulfed the traveler. This charming, friendly girl was no kin at all to her. She had merely made a mistake at the station.

In a flash Alice saw the thing she ought to do. She ought to speak out at once simply and frankly, ask the girl's name, tell her own, explain, and depart for Aunt Margaret and Milton. It would be easy enough to find the way.

"I don't feel a bit like going home. Besides, there's no one there. Are you tired?"

"Not in the least."

"Then let's play about awhile, do something jolly this afternoon. What do you say?"

"I'd—I'd like to."

Impetuously Alice made another decision. It might be reprehensible, but she wanted Peggy. She was bewitched by Peggy. What was one afternoon out of a lifetime? If she spoke and straightened things out, she would never see Peggy again. She forgot to think of the other girl, that girl presumably somewhere at the station, for whom Peggy had really been looking; dismissed with a vague generality Peggy's statement about not being able to read mother's books. That another girl arriving by the same train should have possessed a mother given to writing incomprehensibly might be odd, but didn't quantities of people write books? Deliberately Alice chose Peggy.

It was a wonderful afternoon. The beauty and charm of it took zest from its danger. At any minute some chance word might precipitate calamity. Alice knew her happiness swung by a thread. All her will was bent to keeping the talk in safe channels, away, at all events, from reminiscence and personality. What they did, what they said wove for the lonely girl a shining pattern of delight. Toward evening, when they went "home," wherever home might be, she would pay for it. Then the truth must come out. But she would not grudge payment. She would have her day, always to be remembered.

"You are tired," Peggy accused her

have wonderful times together. Oh, I'm so glad you've come! The next corner is ours."

Alice braced herself. Would they find the other girl waiting? For the first time it occurred to her to wonder how the other girl had made out. And hadn't her infatuation for Peggy herself been disloyal to Aunt Margaret, the aunt she had so wanted to see?

Peggy flung wide a gate. A brick, herringbone-patterned path led to an old-fashioned, brick house bowered in trees.

"I wonder," said Peggy, "whether any of the boys are at home."

As they approached the door it opened and two young men stepped out. One was tall, with crisp curly hair and a firm, pleasant mouth.

"So you got her all right, did you, Peg? I began to think something had gone wrong. Glad to see you, Alice."

The younger, much shorter, round and roly-poly, twinkled all over like a jolly sort of boy-in-the-moon. "How are you, niece?" he murmured, shaking hands impressively. "Peg, have you been introducing our niece to the town?"

"Just a bit. It was good fun, too. These are two of them, Alice, Don and Ralph."

Alice' thoughts whirled. "Two of—of my uncles?"

"They don't all live at home now," Peggy said hastily.

Alice, completely bewildered, turned to her escort. "But you—who are you?" she stammered finally.

"I'm your Aunt Margaret. Didn't you know?"

HINTS FROM HOUSEKEEPERS

Two Good Salmi Recipes

Salmi of Game.—One tablespoon butter, 1 cupful stock, $\frac{1}{4}$ teaspoon lemon juice, 1 tablespoon oil, 1 teaspoon catsup, 6 button mushrooms, 2 or 3 drops onion juice, 1 cup cooked fowl, cut in even, delicate pieces. Melt and brown the butter, add flour and stir until browned. Add stock, stir until it begins to thicken, then add the meat and mushrooms. Stir gently until thoroughly heated and when ready to serve add the catsup, onion extract and lemon juice. Season to taste with salt and pepper and serve. — From Enterprising Housekeeper, by Helen Louise Johnson.

Salmi of Lamb.—Cut cold roast lamb in thin slices. Cook five minutes 2 tablespoons Crisco with $\frac{1}{2}$ tablespoon finely chopped onion. Add lamb, sprinkle with salt and pepper and cover with 1 cup cold lamb gravy seasoned with Worcestershire sauce. Cook until thoroughly heated. Arrange slices overlapping one another lengthwise of platter, pour around sauce and garnish with toast points. A few stoned olives and mushrooms improve this sauce.—From "A Calendar of Dinners." Tested by Marion Haris Neil. — Yorba Linda Subscriber.

HOUSEHOLD QUERIES

Spanish Herbs

In regard to the Spanish herbs mentioned in recipe for cooking pink beans in Cultivator of April 10 last year: Is the oregano the same as sweet marjoram, called *origanum marjoram*? My druggist thought perhaps it was. I have tried a number of grocery stores without success.—Inquirer, Pasadena.

The oregano as purchased at Spanish groceries is a dried herb which looks like sweet marjoram, tastes like it—no doubt is just that. The comino is a seed, cummin, we take it. Five cents worth of each will be sufficient for family use for a long time. No doubt the grocers sell it more reasonably than the druggists. The comino seed is stronger than the herb and generally used in half the quantity. We are mailing inquirer address of grocers in Los Angeles who handle the herbs. This recipe for pink beans, using Spanish herb seasoning, has proved exceedingly popular, every one seeming to like the flavor.

Crumb Pie—Bran Cookies

There are two recipes I am very anxious to find. One is for crumb pie; the other for bran cookies made with honey. My husband is always talking about the crumb pie his mother made, but I have never been able to get a recipe. Then I tasted

"You don't mean it!" "I can hardly believe it!" "Who would think you could get this relish out of prunes!" And more pitched in the same surprised key! For prunes no longer begin and end with stewed. Prunes belong—on any menu. From salad to soufflé, from coffee cake to steamed pudding—there's no limit to the unusual dishes you can make with this fine fruit-food. Our new Recipe Packet—"Sunsweet Surprises for 1922"—is full of sure-to-work-out-surprises—and it's free. Send for your packet today!

—Belle DeGraf
Domestic Science Director

Surprises!

Prune Steamed Pudding

One cup soft bread crumbs; 1 cup chopped suet; 1 cup chopped apples; $\frac{1}{2}$ cup brown sugar; 1 cup chopped, uncooked prunes; $\frac{1}{4}$ cup shredded citron; 1 cup flour sifted with $\frac{1}{2}$ teaspoon each of salt, soda, nutmeg, cinnamon, cloves and allspice; $\frac{1}{2}$ cup molasses; 3 eggs, beaten separately. Mix in the order given, folding in the beaten white of egg at the last. Grease a pudding mold, pour in the mixture, having mold only two-thirds filled. Adjust cover and place on a rack in a kettle of boiling water and steam about three hours, having water boiling constantly.

Prune Bread Pudding

One cup prunes, washed, soaked, pitted and put through food grinder. 2 eggs, beaten; add $\frac{1}{2}$ cup sugar, 2 cups scalded milk; $\frac{1}{2}$ teaspoon each orange and lemon extract, prunes and 1 thick slice of bread cut in small cubes. Pour into buttered baking dish, set in pan of boiling water. Bake in moderate oven until custard is firm in center and bread is browned.

Prune Charlotte

Cooked prunes, pitted and rubbed through a coarse sieve, having one cup of prune pulp. Add $\frac{1}{4}$ teaspoon cinnamon, 1 unbeaten white of egg; $\frac{1}{2}$ cup of sugar. Beat with a whip egg beater until consistency of whipped cream. Fill individual dishes two-thirds full and pile sweetened whipped cream on top. Garnish with a cherry.

Prune Soufflé

Take 1 cup cooked prunes that have been pressed through a colander. Beat whites of 4 eggs until stiff, add 4 tablespoons sugar, 1 teaspoon vanilla and carefully fold in the prune pulp and $\frac{1}{2}$ cup chopped walnuts. Pour in an ungreased pudding dish, set in pan of hot water, bake in a moderate oven until firm. Serve with custard sauce made of yolks of 2 eggs and 1 cup milk or with whipped cream.

Prune Cream Pie Filling

One cup prunes put through coarse sieve; $\frac{1}{2}$ cup chopped walnuts; 1 cup scalded milk; 2 eggs; $\frac{1}{2}$ cup sugar; 1 teaspoon flour; 1 teaspoonful vanilla. Mix sugar and flour; add to beaten eggs; pour the scalded milk over the egg mixture. Add prune pulp and walnuts, mix well and pour into a pan lined with pastry; sprinkle nutmeg over the top. Bake as for custard pie.

Prune Parfait

One cup prune juice, 1 cup cooked prunes; 1 cup sugar; juice and grated rind 1 orange; 2 egg whites; 2 cups whipping cream. Cook prune juice, add sugar with grated rind and orange juice until when the syrup is dropped in cold water it forms a soft ball. Pour gradually, constantly beating, over the stiffly beaten egg whites; beat until cold; add prunes which have been pitted, cut in small pieces and fold in the whipped cream. Turn into a mold and pack in 2 parts finely cracked ice to 1 part rock salt. Let stand at least two hours before serving. To unmold dip mold in cold water, then turn on serving plate. Garnish with pitted prunes stuffed with marshmallows.

Prune Pudding—Delmonico

One cup cooked prunes; 2 cups scalding milk; 4 level tablespoons cornstarch; $\frac{1}{2}$ cup sugar; 2 egg yolks; 1 teaspoon butter; 1 teaspoon vanilla. For meringue 2 egg whites; 4 tablespoons sugar; $\frac{1}{2}$ teaspoon vanilla. Put prunes with a little juice in a pudding dish. Scald milk in a double boiler; mix sugar and cornstarch until well blended; add to hot milk and cook fifteen minutes. Pour over the beaten yolks of eggs and mix well. Turn the custard over the prunes. Beat the egg whites until stiff; beat in gradually 2 tablespoons of sugar; fold in remaining sugar; add vanilla. Spread on top of pudding and bake in a very moderate oven about eight minutes.

some delicious bran cookies at a friend's house, that she said were made with honey. She is ill and I don't want to bother her for the recipe, so I am turning to the Cultivator household department for help and will appreciate it very much.—Subscriber, Healdsburg.

Crumb Pie.—This is an old time Southern recipe: Line pie tin with good pastry and fill with mixture of four cups bread crumbs, one-half pound seeded raisins, one-half pound currants, three-quarters cup cider vinegar, one cup brown sugar, one cup molasses, one teaspoon soda, three and one-half cups cider and a seasoning of cinnamon, cloves and nutmeg. Cover with pastry and bake 40 minutes.

Honey Bran Cookies.—Here is a recipe sent out by the beekeepers during Honey Week: Three cups bran,

one-half cup sugar, one-quarter to one-half teaspoon soda, one-quarter teaspoon cinnamon, one-quarter teaspoon ginger, one-half cup honey, one-half cup milk, one-half cup melted butter. Mix sugar, cinnamon, ginger, and soda with the bran and add the other ingredients. Drop from a spoon upon a buttered pan and bake about 15 minutes.

Hard Soap

In the February 4 issue of the Cultivator is a query concerning scorched lard. I had the misfortune to scorch quite a quantity two years ago. I got concentrated lye and followed the directions on can for making hard soap, and it came out beautifully white and nice. It is easily made and a good bleaching soap though rather strong for the hands. Take any

shallow box and line it with strong wrapping paper, just folded in so it will come up on the sides. It is safer to pour it in out of doors, and keep pets and chickens, etc., away until it hardens. While still soft cut in cakes. Some add borax or gasoline while hot.—Former Subscriber, Modesto.

Italian Salami

This recipe was given me by an Italian woman. They make it every year and it is good:

Take whatever amount of lean pork you wish to make up (by lean I mean most of the fat trimmed off), season with pepper and salt and the following spices to taste, ground cinnamon, allspice, cloves, nutmeg, and whole black pepper. Just a little saltpeter may be used to draw out water, etc., from meat, if intended to keep for any length of time, otherwise it is not necessary.

Run meat through grinder, season and stuff in beef casings and hang up to dry for three or four weeks. Salami may then be smoked or submerged in lard until ready for use when lard may be scraped off and the lard used as usual, as the salami does not injure it in the least.

Lean beef may be added to pork in proportion of five pounds beef to 15 pounds pork if desired. In this case, one bottle of good wine may be added which keeps it from being quite so dry.—Mrs. S. J. Osborne, Arlington.

Sausage

Am sending a recipe for sausage which may do for the subscriber from Lompoc. I never heard of putting wine in and besides where could we find any unless it is home brew?

For each one pound of meat use one heaping teaspoon salt, one teaspoon pepper, one teaspoon sage, and for every three pounds meat one teaspoon each allspice, cloves and ginger with summer savory if liked, and for every 12 pounds meat one-eighth ounce saltpeter. I hope the lady can use this.

We enjoy the paper very much. I am making a cook book of the good things to eat. The only thing is there are so many.—Mrs. L. E. Brookman.

To Clarify Scorched Lard

Use 1 tablespoon baking soda mixed in a little cold water to each gallon of lard. Melt lard and add baking soda solution, let boil and skim all scum that rises. When no more scum rises put in raw potato sliced thin and cook lard slowly till potato is crisp and brown. It will depend on how badly the lard is scorched how much potato has to be used and the lard must not be boiled hard or fast during the process. We used this method several years ago on the ranch when we had some scorched lard and it came out very much improved.

Hope this will help the parties making the inquiry and that they can use this to their benefit. We take the Cultivator and like it very much.—Mrs. R. V. Henderson, Fresno.

CHEESE SUBSTITUTES FOR MEAT

By Mary Ann Gray, State College, South Dakota

The following are good meat substitutes for the noon meal menu:

Cheese Cutlets

Scald $1\frac{1}{2}$ cups milk in double boiler. Stir $\frac{1}{4}$ cup each flour and cornstarch, $\frac{1}{4}$ teaspoon each mustard, paprika, and 1 teaspoon salt, with $\frac{1}{2}$ cup cold milk. Add to scalded milk and cook until the mixture thickens. Add 2 egg yolks, 1 cup cheese in small cubes, and 3 tablespoons butter. Stir until cheese is thoroughly dissolved. Turn into a buttered pan so as to make a sheet $\frac{1}{2}$ inch thick. When cold cut into cutlet shapes, roll in cracker crumbs and fry in deep fat.

Cheese Scuffle

Two tablespoons butter, 3 tablespoons flour, $\frac{1}{2}$ cup scalded milk, $\frac{1}{2}$ teaspoon salt, few grains cayenne pepper, $\frac{1}{4}$ cup grated cream cheese, yolks and whites of 3 eggs. Melt butter, add flour, and when well mixed add scalded milk gradually, then salt, pepper and cheese. Take from fire, add yolks beaten until lemon colored, cool mixture and cut and fold in whites of eggs beaten dry. Pour into buttered baking dish and bake 20 minutes in a slow oven. Serve at once for best results.

THE 1922 GUARANTY SALE

"The Pacific Coast Holstein Classic"

60 SELECT FEMALES and BULLS

This is the fifth Guaranty Sale to be held in California, and the four previous sales have fully measured up to the idea behind their creation—to give buyers an opportunity to select some of the best Holsteins in the west from an offering that has been carefully picked from leading herds.

There will be a wonderful collection of young females in this year's offering, ranging from open heifers up to four year olds, and a few mature cows of excellent breeding and type. The sale will be held on

Wednesday, April 5, 1922

at
Rhoades & Rhoades
Sale Pavilion
Hynes, Calif.

This is the opportune time to buy foundation breeding Holsteins, when the future of the business was never brighter, and the cattle in this offering are essentially foundation material of wonderful quality.

Cattle for this sale were selected by R. A. Condee, Chino; Kenneth W. Abbott, Los Angeles; W. J. Higdon, Tulare; J. M. Campbell, Escalon; F. L. Morris, Woodland; and C. L. Hughes, Sacramento, acting as a Committee for California Holstein-Friesian Association.

UNIVERSITY APPOINTS DAIRY SPECIALIST

Dairy interests of this state are manifesting much satisfaction over the announcement that the extension division of the University of California has secured the services of Noel Negley as dairy specialist.

Negley is one of the best trained dairy experts in the west. He was at one time associated with the Wisconsin agricultural college and later was with the United States department of agriculture. For several years he was stationed at Salt Lake City and was in charge of the western division of the bureau of dairy industry and was largely responsible for the development of cow testing associations. Recently he has been engaged in dairy farming near Escalon.

For several years there has been an insistent need for the services of a dairy expert in the extension division of the California college and it is doubtful if a more satisfactory appointment could have been made. Negley will at once bring to that important division a wide experience and an intimate knowledge of the dairy problems of this state.

JANUARY COW TESTING

No exceptionally heavy producers were developed in the test of the Southern Los Angeles County Cow Testing Association during the month of January. Supervisor Birge reports highest per cent herd test, that of J. G. Gains with 53.7. The highest five cows were in the herd of John Van Ruiten, with total of butterfat 435.6. The second highest was the herd of George Webb with 390.1 pounds. Highest cow in pounds fat is from dairy of J. Van Ruiten, 98.3. Highest average in number of pounds fat, Van Ruiten, 55.1. The average fat per herd of the association, 44.

Cows with a monthly production above 45 pounds fat were found in the herds of George Trail, 45.1; S. W. Bockema, 46.5; Paul Taylor, 47.6; D. H. Dillon, 48.9; John Van Ruiten, 55.1; Wilber Bros., 48.2; J. Verburg, 53.2; George Haight, 46; George Webb, 45.

UNIVERSITY BUYS NEW DUROC BOAR

The Duroc-Jersey boar Ainti Sensation was recently sold to the University of California to head their herd at Davis. This purchase marks another step in the advancement of the breeding industry in California, for in the past the university has always found it necessary to go into the herds of the Middle West to secure the correct type of sire for student judging and for use as a breeding boar. This boar was purchased from Wm. V. Mong of Whittier. He was bred by Diamond Bar Ranch and sired by Mammoth Sensation Jr. He is the junior champion of the 1921 state fair, and with his litter mates won more premiums at the strongest California fairs than any one litter has taken in the last five years.

1922 FAIR AND SHOW DATES

The following dates for 1922 fairs and shows have been announced by the Western Fair Association. H. E. Patterson of Fresno was elected president of the association.

Sonoma County fair, Santa Rosa, August 23-27.

Colusa County fair, August 24-27.

State fair, Sacramento, September 2-10.

Fresno County fair, September 25-30.

Orland fair, September 18-23.

Red Bluff fair, September 11-17.

San Joaquin Valley fair, Stockton, August 16-22.

Tulare County fair, September 12-19.

Hanford fair, September 20-23.

Anderson fair, September 28-30.

Bakersfield fair, October 2-7.

Butte County fair, October 2-7.

Ventura fair, October 3-8.

Riverside fair, October 10-15.

San Francisco Livestock show, October 18-22.

Imperial Valley fair, October 24-30.

Orange and Olive festival, Oroville, November 28-December 2.

California rodeo, Salinas, July 24-29.

FISK

TIRES

RED-TOPS

proved their merit—
sales grew five-fold

IN a mountainous region in a Southern state, where there is not a single good road in four counties—

— Fisk Red-Tops have increased in sales five-fold in three years.

— Because they gave remarkable service, where other tires were ground up and torn to pieces on the flinty shale and racked highways.

This is only one of the many instances where Red-Tops won out against all competition on merit alone.

Comparison tells the story

W. F. YOUNG, Inc., 244 Temple St., Springfield, Mass.

Plenty of Milk Freely Given

One of the most common causes of milk loss is overlooking the apparently little injuries or troubles with the udder and teats. The slightest hurt makes milking hard, makes the cow nervous and irritable and means a sure holding back of the yield.

Bag Balm is made for just such a use—to quickly heal any cut, bruise, chaf, or inflammation. Its great penetrating and restoring qualities put the tissues back to normal condition, make the cow comfortable and the milking easy. Bag Balm gives quick relief in case of Caked Bag and for treating Bunches and Cow Pox.

Your feed dealer, general store or druggist sells it at the reduced price of 60c.

DAIRY ASSOCIATION CO., INC. Lyndonville, Vt.

BAG BALM
MADE BY THE KOW-KARE PEOPLE

There are so many every-day uses for this great healing ointment that no dairy ought to be without a package at single day. The big 10-ounce package lasts so long and gives such complete satisfaction that thousands of cow owners consider it a most necessary aid to profitable dairying. Write for free booklet, "DAIRY WRINKLES."

Kow-Kare and Bag Balm distributors for California,
Germain Seed and Plant Co., Los Angeles, Cal.

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years.....	2,040.97 Pounds
Milk	2 Years.....	41,547.20 Pounds
Butter	1 Year.....	1,130.66 Pounds
Milk	1 Year.....	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days.....	30.47 Pounds
Milk	7 Days.....	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

April 5, Guaranty Sale, Rhoades & Rhoades, Pavilion, Hynes.

Berkshires

February 27-28, American Berkshire Congress Show and Sale, Riverside.

Eldorado Veeman Segis, a junior two year old daughter of King Sadie Vale Idyl Segis, recently made the splendid record of 25.48 pounds butter from 407.1 pounds milk in seven days. She is out of Jeanie Veeman of Sunnyside, who in turn is out of the well known 30 pound cow, Melba Hengerveld. She is owned by M. P. Christensen, Norwalk, who purchased her in the Alex Whaley dispersal at Tulare last November.

Members of the Oregon Dairymen's Cooperative League have voted to liquidate the affairs of the organization and a committee of nine, three from each of the three zones in the state, have been appointed to arrange a reorganization.

Chas. W. Lucas of Honolulu has been visiting Holstein breeders in this state and has selected a number of high class females for exportation to the islands. From William Dreher, of Sacramento, he secured the 1033 lb. cow, Sugar Queen Topsy, her six year old daughter, Sequoia Sugar Queen Hengerveld, and her four year old daughter, Sequoia Pontiac Cris. The acquisition of this trio gives Mr. Lucas a splendid foundation from a family that promises much and the additional honor of exporting the first 1000 pound cow to the islands. Mr. Dreher also furnished the three year old Susie Fobes and the two year old Jettine Ruby De Kol Posch 2nd. Mr. E. F. Gleason of San Juan Bautista. Lucas selected six head, including Segis Woodcrest Maid, a 25 pound three year old; Steno Alta Pietertje Posch, a 19 pound senior two; Liscomb Aaggie Korndyke, a 23 pound junior three and three two year old heifers. Vern Heath who has been associated with the Gleason herd, assisted in the selections and expects to take the cattle to the islands. It is probable that Heath will locate there.

In the recent dispersal of the well known Poland China herd of Fran Winn, Kansas City, Missouri, M. Bassett and Sons, of Hanford, secured two of the top sows. Both are two year old daughters of W's Giant and are said to have splendid records as producers.

The regularity with which the daughters of the Bridgford Holstein Company's herd sire, King Segis Alcartra Prilly, are registering outstanding records in making a deep impression in California Holstein ranks. We have already reported five remarkable records, including one world record, and now comes the sixth daughter, Maid Pontiac Prilly, freshening at the age of two years and two months, with 26.75 pounds butter from 540 pounds milk in seven days. King Segis Alcartra Prilly now has six first-calf heifers with average production of 26 pounds butter and 518 pounds milk.

C. L. Hughes, secretary of the California Holstein-Friesian Association, and manager of the California Breeders' Sales and Pedigree Company, is temporarily out of commission and will be confined in the hospital for ten days or two weeks. Hughes contracted a severe cold with complications following a trip to Reno, Nevada, where he addressed a group of dairymen.

The top Poland China sale of the season made an average of \$175 and was held by Lester Glover of Missouri. The top price of \$1,000 was paid for the aged sow Lockridge's Giantess.

H. M. Barngrover, well known Hereford breeder, has removed from Santa Clara to Stockton and expects to maintain part of his herd at that place as soon as a suitable location can be found. His main herd will continue at Taylorsville, Plumas County.

At a recent meeting of civic and business interests in San Francisco

the matter of permanent exposition building suitable for housing the California National Livestock Show was discussed and it is expected that favorable action will be taken early this spring. Once a permanent building is provided for that livestock event California breeders can be depended upon to do their part in establishing one of the great shows of the United States.

Cattlemen of Nevada say that practically all the available bulls in that state have been taken by range interests and that many outfits will be forced to come to this state to fill their needs. Prices have ruled strongly with a distinct preference manifested for bulls of quality.

Professor Gordon H. True of the animal husbandry division is recovering from an attack of pneumonia contracted on his recent trip to the National Livestock Association meeting at Colorado Springs. Professor True expects to be able to participate in the events scheduled for Stockmen's Week at the university farm.

Livestock consisting of more than 9,500,000 cattle, sheep, horses, swine and goats, grazed on the ranges of the national forest during the past fiscal year.

During the recent National Western Livestock Show at Denver 44 head of Herefords made a general average of \$380. The bulls averaged \$391 and the females \$363.

members from the middle western states, to be known as the Farmers' National Livestock Marketing Association, was formed recently at Kansas City, Missouri, the object of which is the cooperative marketing of cattle to eliminate the payment of commission to outside agents.

SUMMARY OF PETALUMA COW TESTING ASSOCIATION

The Petaluma Cow Testing Association finished this year's testing August 31, 1921, having tested 1,350 cows. The average of these cows was 248 pounds butter fat per cow. This includes every cow in the association, regardless of the length of her lactation period. The association shows an increase of 23.8 pounds per cow over the average of the previous year, which is 10.8 per cent additional production for each cow. The highest herd average was 396.8 pounds per cow, this herd being a pure bred Jersey herd of 36 cows belonging to A. B. Purvine. The number of poor cows, or those producing less than 200 pounds was decreased from 721 in 1920 to 373 in 1921; and the good cows, or those producing over 300 pounds, increased from 149 to 319. There were 17 herds that were tested for the last two years, and these increased from 241.6 in 1920 to 284.3 in 1921, or an increase of 42.7 pounds butter fat per cow, against the increase of 23.8 per cow for the whole association. In other words, those testing the previous year, showed the influence of testing not only through a higher average last year, but an increase this year greater than the average run of dairymen in the association.

Last year there were quite a number of grade and scrub bulls in the association, and this year the association started with six grade bulls. During the year three of these dairymen purchased purebred bulls at the annual farm bureau bull sale, which reduced the number to only three grade bulls in the association.

During the year 235 culls were sold as a result of the testing, which eliminated 18.6 per cent of the cows that were the lowest producers. Aside from the value that the dairymen have received from the testing work, they have adopted more progressive methods in management and have fed much more scientifically than heretofore. The results will show up even more in the years to come than they have in the comparison between the two years of testing that this summary contains.

Below is given in statistical form a few of the facts:

	1919-20	1920-21
	Lbs.	Lbs.
Average production per cow of butterfat.....	223.8	248.0
No. cows producing less than 200 lbs. butter fat	721	378
No. of cows producing between 200-300 lbs. butter fat	593	568
No. of cows producing between 300-400 lbs. butter fat	133	267
No. of cows producing between 400-500 lbs. butter fat	13	43
No. of cows producing between 500-600 lbs. butter fat	3	8
No. of cows producing between 600-700 lbs. butter fat	4	1
Av. production of herds which were tested both years	241.6	284.3
No. of grade bulls at beginning of year.....		6
No. of grade bulls replaced by pure breeds.....		3
No. of culls sold during year		235
Per cent culls sold during year		18.6

PERTINENT PARAGRAPHS

By A. L. Spellmeyer

It has taken two years of tremendous effort to convince this generation that city prosperity depends upon country profits.

Abandoned farms dot our congested population states. Spendthrift of natural resources, we move to new land, as average profits are too small to renew exhausted soil.

Total dairy and beef cattle have declined over 8,000,000 head in this country, and most of the range cattle

have declined in quality and breeding during the last three years, owing to drought and heavy money loss, which did not permit bull expenditure.

Even the California farmer has his difficulties this year, beans don't sell, and beets run against a low sugar price, raisins get early showers, hay is hit in the field, fruit in the blossom, and finally oranges are frosted.

The country is being taxed heavily. Ranches that have not produced a dollar profit for two years are forced to pay double the taxation placed upon a city building of equal value, in many instances.

A semi-peasant state with a bare margin to existence would result in a permanent continuance of existing agricultural conditions.

A Chicago banker tells us all to work hard, and we will be prosperous. We would ask, WHY when the more we raise the more we lose?

Harriman's theory was that banks should conserve in good times and loan to a bare bone margin in depressions, but our bankers are not Harrimans. A bank that has a hundred and fifty millions in idle deposits and less than thirty million out in loans in these times should add, the words, "SLACKER" to its window sign.

Henry Ford and Hugo Stinnes are two men who have built up during the depression period. Henry Ford the American and Hugo Stinnes the German Jew have followed one funda-

mental procedure, different in application and motive, but identical in the fact; it is complete control of their products from the mine to the consumer, and all the middle profits. There is a lesson in this for producers.

WASHINGTON DAIRYMEN WIN

The Washington Farmer announces that an agreement has been signed in Spokane between the Inland Empire Dairy Producers' Association and all of the principal milk distributing companies of that city except one, under which the distributors agree to purchase practically all of their milk supply for a period of three years from the cooperative association. The price to be paid at the present time is \$2.85 per 100 pounds net to the producers' association for 3.7 per cent milk. All the milk will pass through the by-products plant of the association, where it will be weighed and tested, but each private distributing company will process its own milk in its own plant. The producers' distributing company, which is composed of former milk drivers, will continue to receive its supply of processed milk direct from the producers' by-products plant.

The agreement also provides that the retail price of milk in the city of Spokane shall be 13 cents per quart, instead of ten cents, which it has been for several months as a result of the milk war between the producers' association and the private distributors. The new price is already in effect.

BERKSHIRE SALE AT RIVERSIDE

The American Berkshire Congress Sale and Show at Riverside, February 27-28, is rounding up in good shape. The sale catalog will be ready for mailing in a couple of days, and it includes an attractive collection of Berkshires, rarely offered at public sale. The Berkshire breeders seem to have caught the promotion spirit and are outdoing themselves in consigning the best in their herds.

An idea of how the Berkshire breeders are backing up this event may be gathered from the fact that to date 22 breeders have entered animals in the show. Among them are Fred Sinnes, Prosser, Washington; State Agricultural College, Corvallis, Oregon; Hazen Cornelius, Ontario; Mary Beard, Cucamonga; University Farm, Davis; Italian Vineyard, Guasti; L. L. Clark, El Monte; Van Fleet, Cucamonga; Donald Clement, Chino; R. S. Jones, Etiwanda; Stella Mae Dillard, Etiwanda; Chester T. Johns, Cucamonga; Beard Bros., Cucamonga; California Truck Co., Los Angeles; H. V. Nelson, El Monte; Homer Banillas, Cucamonga; Iowa Farms, Davenport, Iowa; Rockwood Farms, Ames, Iowa; E. J. Barker, Thorntown, Indiana; F. L. Hall, Perris.

Over 20 high schools of the southern section are entering teams in the junior department judging contest. R. (Continued on Page 219)

DEPENDABILITY

WIZARD

4-PULL TRACTOR

Why These Features are Tremendously Important to You.

1. Rigid 4-Wheel Drive.
Shoes on all four wheels are set at an angle that literally gears them to the ground, giving the Wizard all the traction of a track type tractor, and under some conditions more; but, without the never-ending up-keep expense of the track machine. Steers by slowing wheels on one side. Most easily handled under all soil conditions.

2. No Oil or Grease Cups.
The Wizard is automatically oiled thru-out. Not a single oil or grease cup to fill. Hours of time saved every week.

3. Completely Enclosed.
Every working part—except wheels and fan—is absolutely protected against dust and dirt.

4. 35% Reserve Power and Strength.
The motor—when doing normal work—still has 35% of its power in reserve. The rest of the Wizard is built with over-size parts to support this extra performance whenever needed. Bosch magneto. Timken mounted throughout.

A PROVEN TRACTOR

The Wizard is the result of 30 years of experience and development by practical tractor men. It is a **perfected tractor**. All the experimenting has been done and paid for by the manufacturer. It works 99% of your work day. It is the lowest priced per drawbar horse-power of any tractor on the market when days of work are considered.

We want you to know all about this revolutionary tractor. Send for the complete story of the Wizard.

WIZARD

A Revolutionary 4-Pull Tractor

With These Fundamental, Exclusive Advantages:

1. The only tractor with a rigid, 4-wheel drive.

2. The only tractor built without a single oil or grease cup.

3. The only tractor that is absolutely enclosed.

4. Has 35% reserve strength after delivering normal pull.

BERKSHIRE SALE AT RIVERSIDE

(Continued from Page 217)

A. Condee of Chino has been appointed superintendent of the contest work.

The silver cup offered by the Southwestern Berkshire Congress to the winning judging team is on display in a store window at Riverside along with about six others which have been donated by progressive business firms who are cooperating with the Berkshire boys in boosting the livestock industry of the West.

C. I. Hood, owner of Hood Farm, Lowell, Massachusetts, and one of the most constructive breeders of Jersey cattle and Berkshire swine, died February 5. Hood Farm came into prominence through the development of the Sophie Tormentor strain of Jerseys.

Vitamines

SAYS the Cooperative Poultryman:

A man who thought himself a scientist was remonstrating with a farmer for feeding his hogs so much succulent green feed. "Why, man, 90 per cent of that green feed is water." "Well," said the farmer, "it is mighty good water anyway and the pigs thrive on it." These two men were discussing the influence of vitamins, but neither of them knew it. Years ago our experimental stations found that milk fed swine gave results far in excess of the actual solids present. What we now call vitamins produced these remarkable results.

Millions of people on the east coast of Asia have been using sprouted beans as an article of diet because experience has taught them that the young sickened and died from malnutrition when subsisting on grains and, in addition, the beans prepared in an unsprouted condition. The partially civilized people probably never heard of vitamins, but at least they saw results.

In like manner it has been noted for a long time that feeding sprouted oats and barley to hens, especially during the fall and winter months, tended to produce more eggs. Hundreds of poultrymen have failed to make the poultry game pay because they depended exclusively on mangels, cow melons and pumpkins for green feed. Books told them that these were valuable, but the hens lacked something essential notwithstanding the advice on the printed page, and that something we call vitamins.

There is some connection between vitamins and available organic ash. Fed the milk of an ill nourished cow, a calf does not thrive naturally. Chicks hatched from eggs laid by poorly fed hens have small frames with puny legs and feet. Vitamins have some control over the availability of the organic ash used to build up blood and bone.

The basic facts involved in a discussion of vitamins were noticed and dimly understood generations ago, but the great benefit derived from more recent investigation has been to confirm with scientific accuracy what some close observers had believed was true. Some folks think that the conclusions arrived at in working out this whole problem have been in the nature of rebuke to those extreme materialists who thought they could measure the deep things of life by chemical formulae rather than by exhaustive feeding tests. The conclusion reached in regard to vitamins refutes the claim that so much protein, carbohydrates, fat and ash, chemically determined, will represent the food value of any material under discussion. We only know that some foods tend to produce natural growth when fed to the young and other foods do not. Some foods tend to prevent the diseases resulting from a ration improperly balanced; lacking these foods, birds and animals suffer the ills of malnutrition.

What does a vitamin look like? Nobody ever saw one. It is true that by the use of metallic salts material containing vitamins may be concentrated to a remarkable degree; however, complete separation has not yet been accomplished. One of the disconcerting facts about some vitamins is their unstable and perishable characteristics. They exist so near to nature's wonderful laboratory that often high temperature or contact with so harmless a compound as baking soda destroys them. One of these vitamins is called "Fat Soluble A." As a person would expect, it is found in certain fats, not all fats, but only a few. This is the vitamin which exerts such a powerful influence on the growth of the young creature. We find it in butter fat, the fat of egg yolk, the internal fat of animals and fish, and to some degree in the fat of the rice kernel. During the past few months Japan has shipped thousands of tons of rice polish and high grade rice bran out of California to improve the ration of her people because it has been found that these rice by-products cure some of the ills of malnutrition.

While the intelligent poultryman has received much light on the whys and wherefores of poultry feeding, and as a result has received help with some of his problems, yet investigation of the so-called vitamins has not tended to revolutionize the best ideas on poultry feeding. It has rather tended to confirm present ideas than to suggest different methods of feeding. Those who have seriously investigated the production of hatching eggs have observed in a crude way what our learned friends have now demonstrated with greater accuracy in tabulation and other detail.

The advantage of using milk in the poultry yard is more firmly established than ever. The fact remains that a certain amount of non-rancid fat is a great advantage, not only to the laying hen but to the growing stock. The problem naturally will be to prevent excess of rancidity. Growing green feed cannot be wholly displaced by any succulent material such as mangels, cow melons and pumpkins without producing serious results. While the sprouting of grain is not absolutely essential when growing green feed is supplied, yet it tends to supply those vitamins which exert some control over making the organic ash content of feed available. In conjunction with tender green feed and properly sprouted grain the organic ash found in wheat bran and fine bone, for example, becomes more available, not only to laying hens, but also for chicks and growing stock.

Even the candler of market eggs can usually tell by the density and other characteristics of the egg in his hand whether the hen producing it has been fed properly, which usually means whether her feed contains material rich in those growth elements which we now call "vitamines" for want of a better name.

Poultry Queries

Conducted by Jean A. Koethen

Turkeys in Coachella Valley

What information can you give regarding turkey raising in Coachella Valley? What are the special problems there?—Subscriber, Indio.

As far as I know the problems are the same as in all our warm, dry, interior valleys. Shade and abundant green feed must be provided, and insect pests, which are always a more difficult problem in a hot climate, must be kept under control. It is generally believed that turkeys do better in these dry, interior valleys than near the coast. We should be glad to hear from Coachella subscribers on this subject.

Milk for Turkeys

What would you feed young turkeys if sour milk is not available? Is there a substitute just as good? Do our large turkey raisers depend on sour milk?—Subscriber, Turlock.

If there is a substitute just as good it is the bugs and worms that are found on moist, green range. In fact, the bugs and worms are the poul's natural food, and sour milk is the best substitute. When sour milk cannot be had beef scrap in the mash is a fair substitute, but some large turkey raisers start their birds on the familiar bread and egg and greens or rolled oats, egg and greens, and continue to feed a little egg till the birds are from six weeks to two months old, when they are shifted onto bran and barley with no animal food at all.

Old Hens

We have 1,200 hens that will be two years old in March. They have been laying very well. Shall we keep them another year or are they too old to be profitable?—Subscriber, Cupertino.

Never sell a hen that is laying satisfactorily, no matter how old she is. Some hens are profitable in the third and even in the fourth year, but the majority are not. The thing for you to do is to cull out this coming spring and summer every hen that stops laying for any reason whatever. If she

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus *Bacterium Pullorum* transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: Last spring my first incubator chicks when but a few days old began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged. Finally, I sent 50c to the Walker Remedy Co., Dept. 593, Waterloo, Ia., for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We never lost a single chick after the first dose. We raised 700 thrifty, healthy chicks, where before we never raised more than 100 a year. I'd be glad indeed to have others know of this wonderful remedy. Ethel Rhoades, Shenandoah, Ia.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 593, Waterloo, Ia.

Stop Hatching Weak Chicks

Chicks that hatch a few days mean out weak and wobbly, and live but nothing to you but trouble and loss. with cheap incubators. Remember, it is not how many you hatch that counts but how many you raise.

Queen Incubators

produce large hatches of strong, vigorous chicks that live and grow. The Queen is accurately regulated—taking care automatically without attention of a variation in temperature of 70 degrees without danger to the eggs. It is built of genuine Redwood—very scarce in these days of imitation. Redwood does not absorb the odor from hatching chicks. Cheaper woods and strawboard or composition lining in iron or tin machines, retain the odor, to weaken and kill the chicks of later hatchery.

Queen Incubators and Brooders are sold by dealers everywhere. Send for Free Book. (42)

LEE'S LICE KILLER

Kills lice, mites, bed bugs, etc. affecting poultry. Spray or paint on roosts, etc. Gets body lice on chickens, too. Works while they sleep. No dusting, dipping, greasing or bandaging. Saves lot of unpleasant work. At most towns, at stores handling Lee Poultry Supplies. Write for information and FREE Book. GEO. H. LEE CO., Dept. F-30. OMAHA, NEBR.

goes broody before July or more than once after July 1 remove her. If she begins to moult before September 1 remove her. If her comb becomes pale and withered or she shows any indication of weakness or sickness remove her. If, after you have removed all hens that are evidently not laying, production should drop below the proper average for the time of year, go through the flock and remove the hens with hard abdomens and stiff pelvic bones. All hens that are still laying in October should certainly be kept.

Home Made Brooder

J. H. Ritchey of Runnington sends the following directions for a home-made brooder in which he brooded 100 chicks for two months last fall:

The lid of a medium sized zinc trunk was lined with a sheep skin and two small doors chiseled in the front. With the west side closed tight and the doors open toward the east and bottom covered with straw, this brooder, which was placed on the south side of the barn, successfully housed the 100 chicks till they grew too large for it. Then a lined box the same height was added, and both banked with dirt.

Mr. Ritchey also recommends keeping sulphur in a box in the hen house where the hens have constant access to it. This is a preventive of chicken pox and also a help in molting.

The Family Flock

I want to raise about a dozen hens to supply our household with eggs and raise a few baby chicks occasionally. What varieties do you recommend and what are the food requirements for a laying hen?—Subscriber, Pasadena.

You will make no mistake in selecting one of the three American breeds, Rocks, Wyandottes and R. I. Reds. A dozen hens of either of these breeds will provide all the eggs your family can use (unless it is exceptionally large), hatch and rear 75 to 100 chicks in the spring, furnish fryers for all summer and roasting hens for your winter Sunday dinners, with a fine young rooster or so for the holidays. You can have your pick of colors: white, red, buff, barred, black and white or laced, and keep them in a small pen where they will be in nobody's way. Grain once a day, a laying mash always before them, and all the greens they can consume are the feed requirements of the family flock. Add to these your table scraps and kitchen waste cooked up once a day and thickened with bran or with the regular mash and you should have eggs every day in the year.

Vegetables as Greens

Are stock beets and carrots as good green feed as alfalfa or clover?—Subscriber, Eureka.

Certainly not, for they are not green. They contain some of the mineral salts and a good deal of fiber, as well as a considerable amount of sugar and starch, and are valuable feeds in their way, but they are not green, and do not take the place of succulent greens, alfalfa, clover, green barley, kale, chard, alfilaria, etc.

Chick Feeding

I would like to know more of the Poultry Division's method of feeding baby chicks, as referred to in the article "10,000 Dozen Eggs from 600 Hens." To whom shall I write for information?—Subscriber, San Jose.

Write to the University of California, College of Agriculture, Berkeley, for circular on the care and feeding of chicks.

Culling Pullets

At what age should pullets be first culled by the process of finding the space between pelvic and breast bone? Would you mind telling us just what process of culling you use in your own flock? If you have a previous article on this subject perhaps I can obtain that number. We are new subscribers.—Subscriber, El Centro.

Culling in general was discussed in the issue of May 28, 1921. Hoganizing, as the method of culling to which you refer is called, is used for

International 8-16 Cut \$230

Now \$670 f. o. b. Chicago

and a P&O 2-furrow Plow FREE

The International 8-16 is not a stripped tractor pared down to make a price, but complete with all essential equipment—*belt pulley, fenders, platform, throttle governor, adjustable drawbar, angle lugs, brakes.* This equipment, worth more than \$100 and necessary on any tractor to make it serviceable and safe, is included in the new \$670 price. *No extras to buy.*

Titan Price Now \$700 f. o. b. Chicago

This new Titan price is sure to interest any man who wants a real 3-plow tractor, with belt power in proportion. Remember that 3-plow capacity cuts the labor cost on every field operation. Note that until May 1, 1922, every farmer purchasing a Titan tractor covered by the Special Offer will be given a P&O 3-furrow plow free. If the purchaser now owns a suitable plow we will substitute a tractor disk harrow.

Greatest farm power values ever offered. Neither horses nor any other tractor can equal them.

Special Offer Expires May 1st. See the McCormick-Deering Dealer Now!

IXL almonds, 25 lb.; soft shell almonds, 16; do, hard, 10; budded walnuts, 32; soft shell walnuts, 30; Manchurian walnuts, 14; Brazil, 17; pecans, extra large, 23; Filberts, 14 lb.

HONEY

California Points: Prospects for next season's crop considered favorable, both as to volume and quality, if spring rains are normal. The prolonged cold spell earlier in the season caused a setback to bees in some sections, with many colonies considered depleted in numbers. Prices show a little change over those prevailing two weeks ago. Since the heavy rains, many bee keepers have disposed of their reserve supply of honey, and those still holding are increasingly inclined to sell.

"Honey Week," authorized by proclamation of the governor of California for February 6 to 11, inclusive, may slightly have helped retailers to dispose of their surplus stock, but apparently has not as yet stimulated buying from the brokers. Quotations continue largely nominal. Recent carlot sales of light amber alfalfa are reported at 6½ cents per pound; one of light amber sage at 7½ cents, and one of white orange blossom and sage at 11½ cents per pound. Other flavors can be quoted nominally about as indicated in the last report.

HAY AND FEED

A. W. Scott & Co. says:

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Citrus Markets

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California:

Oranges, 5,702 cars; lemons, 2,031; total, 7,733. To same date last season: Oranges, 7,027; lemons, 1,827; total, 8,854.

From Central California to date this season: Oranges, 4,194; lemons, 97; total, 4,291. To same date last season: Oranges, 4,027; lemons, 88; total, 4,115.

From Northern California to date this season: Oranges, 369; lemons, 7; total, 376. To same date last season: Oranges, 305; lemons, 4; total, 309.

Vive La France, the Jersey cow that recently completed her fifth great record, dropped her sixth living calf on January 1, 1922, and immediately started on her sixth consecutive record. Her first five records are the most sensational ever produced by any dairy cow, living or dead, for a like period. Her total butterfat production is 4415 pounds as against her nearest competitor for a like period with a record of 3860 pounds. Not only has Vive been a consistent butter producer, but she is also remarkable from the fact that she has six living sons and daughters all born before Vive was eight and one-half years of age. She has won three gold medals and three silver medals on her remarkable records, and now holds the world's record over all breeds for five consecutive years' production. She is the only cow in the world with two yearly records each above one thousand pounds of fat. At the Pacific International exhibition in 1919, in a competition of 187 animals, she won first prize and grand championship.

Carnation Stock Farms, Seattle, announce the purchase of practically the entire Holstein herd owned by F. R. Beals of Tillamook, Oregon. The deal included 68 head for which an average price of over \$500 was paid. Among the females secured was the northwest champion, Lady Aaggie Ormsby of Rock.

Dr. W. H. B. Medd, V. S., and Raymond Gard have bought Hampshire hogs and poultry of the Braemar ranch. Dr. Medd has had wide experience in handling pure bred stock. The firm will specialize on Bronze turkeys, Buff Orpingtons and Pekin ducks. This ranch recently supplied H. E. Horner of Atascadero foundation stock for a flock of Bronze turkeys. The same ranch also supplied to Griesdale ranch of Nevada a fine yearling Bronze tom topping the scale at 33 pounds.

BRANCH OF BIG HOUSE

In order to more quickly supply the farmers and orchardists of Orange County with implements and parts it has been announced that the L. M. Rallsback Company has opened a branch at Anaheim. All the well known lines now carried by this firm will also be in stock at the new location.

A complete stock of tools and parts will be on hand at all times and service men will be ready to attend to the needs of farmers and orchardists on short notice. It is said that the new branch will carry the largest and most complete stock of implements in Orange County. The branch will cooperate with other dealers in Orange County, as it is planned to operate a retail and jobbing business.

BIRDSEYE VIEW OF THIS AND
PAST YEARS' FREEZES IN
SOUTHERN CALIFORNIA
(Continued from Page 203)

er, whether it may be wet or dry, hot or cold, is in making provision for the extremes. It is the farmer who does his regular fall and winter plowing at the appointed time by the calendar who will be ready for the rains when they come. It is the thoughtful fruit grower who within the next few weeks takes an inventory of his oil pots, storage tanks and thermometers who will be ready for the autumn and winter frosts. The fruit grower this season will use his experience of last year and check up his temperature indicators, those invaluable adjuncts to fruit protection. If in the past he has not availed himself of the opportunities offered to have his thermometers tested he will see to it that the Thanksgiving frosts do not find him unprepared." Third, the systematic, businesslike administration of orchard heating. Artificial heating of an orchard should be classed with such necessities as irrigation and fumigation. Proper orchard heating apparatus should be the rule, not the exception; small heaters should be scrapped, and heat, not smoke, the object sought. This phase of the problem must be given that earnest, thoughtful attention which it deserves from such eminently practical men as the citrus fruit growers of California. Fourth, the study of local temperature records (being careful to destroy those false watchmen, inaccurate thermometers, of which there are hundreds in California) and their application through the nearest weather bureau records and local 12 to 36 hour forecasts of frost probability. Fortunately the weather bureau officials were in the field this winter with elaborate and efficient apparatus for the study of frost so that much will be gained from this season's experience for the future use of the fruit grower.

A consideration of the frost problem, which by reason of its far reaching effects demands more than ordinary attention, inclines the more thoughtful to the belief that the successful fruit grower is one who unprejudicedly considers the situation in all its unpleasant but necessary details and is willing to profit by experience. He will find that this year's frost was not more severe than half a dozen frosts within the past 50 years, but was more damaging because of the aggregate plantings and the absence of suitable preparation for frost protection in many localities. He now sees the necessity of careful research into the heating problem, realizing also that accurate thermometers are essential to effective application of heat to his groves; that all groves should have ample frost insurance, i. e., proper heating devices; that the value of the premiums thus paid is trifling compared with the 50 per cent loss without such protection; that a small grower will be successful only by close cooperation with his neighbors; that immunity from frost one year is no guarantee of immunity in another; and that no region is absolutely frostless.

POULTRY QUERIES
(Continued from Page 221)

grading the pullets before they begin to lay, but is only one of several tests which are employed for weeding out the unprofitable members of the flock. Pullets which go broody too soon or too often, pullets which molt too early, pullets which stop laying before molting time for any reason, should all be eliminated. The color test, which is applied any time from May to September or October, is one way of picking out the early molters. The hen with bright yellow legs in September is usually the hen that has already molted. The hen with bright yellow legs in May has not molted, but neither has she been as industrious as her more faded sisters. As my own flock is small and does not consist of Leghorns, I go more by comb and distance between pelvic bones than by color. A hen with a shrunken comb and pelvic bones that are stiff and close together is not laying, that is sure. How soon she will lay again depends on her age and the time of the year and also on how fat she is. A Rock or Red that once gets too fat to lay is apt to be hopeless.

Select
Fruit Trees
FOR ORCHARD
or GARDEN~

FEIJOS—New hardy, grafted, large-fruited varieties named "Cholceana" and "Superba" which easily stand fifteen degrees above zero.

LA FRANCE RASPBERRIES—Giant ever-bearing—big, sweet, juicy red raspberries, bearing from June until November. New, but thoroughly tested.

MAMMOTH THORNLESS BLACKBERRIES—True Cory strain, vigorous growing plants, sending up stocky canes twenty feet in one season. Thornless, making picking easy.

ALMONDS—All leading varieties on Peach and Almond root for commercial planting. Write or wire for price.

ROSES—One hundred newest and best sorts; strong, field-grown plants including latest introductions: Los Angeles, Mrs. S. K. Rindge, Mill Lolita Armour, William F. Dreer, and many others fully described in our catalog.

POPLARS

For Avenue Planting

THE LOMBARDY POPLAR, as pictured is a tree of very erect slender form, reaching a height of seventy-five or eighty feet—a tree of extraordinary rapid growth; is very seldom attacked by the Borer, which is generally prevalent in other varieties of Poplar. The Lombardy Poplar is possibly one of the most attractive avenue trees in the state, being a beautiful green throughout the entire summer and changing to a brilliant golden color in the fall. These trees can be transplanted practically at any size. They suffer no injury from heat or frost.

Next in order among the Poplars is the Carolina Poplar of a more spreading growth, and larger leaf than the preceding. While this variety makes a beautiful avenue tree, its principal value is in its dense shade.

what method of feeding do you use—

trust
-to-
luck

or

trust
-to-
cluck

THE difference between a poor-paying flock and a profit-paying flock is the difference between take-chances and take-NO-chances. Indifferent, haphazard, "trust-to-luck" feeding will never pay. It can't! Nothing will rob you of your rightful profits as quickly as blind feeding. True, your hens may live and be fairly healthy on a poor ration. But—

You are in the poultry business to make money. The more eggs you get the more money you net. You must realize, then, that it takes an excessive amount of a hen's energy to convert poor feed into money as against converting good feed into money. So that—far from saving money—the only result of a "cheap" ration is a *higher cost* for each dozen eggs produced.

A tasty, well-balanced ration is absolutely necessary for maximum production—that's sure! Equally sure is the fact that a uniform, quality-feed like SURELAY pays its way—and more! Its slight added cost comes back to you many times over in the extra eggs produced.

Have you ever compared the results you're getting from "trust-to-luck" feeds with the results other poultrymen are getting from SURELAY? After all, the real profit-point is this: What do your *hens* think of the feed you give them—and what do they do with it?

Why not put this egg-production question squarely up to your hens? Feed them SURELAY—a prime, true-to-test formula that has weathered the years—and let the results speak for the feed and for us. Meanwhile we suggest that you write for your copy of the new, enlarged edition of "Makes Hens Happy." It is the most complete and helpful handbook on poultry husbandry we have ever issued—and it's free. Simply clip the coupon—and mail today!

Four of a Kind and All Ready to Work

Well matched in weight, in color and in disposition. Four willing workers on the Santa Anita Ranch, Los Angeles County. Property of Mrs. Anita Baldwin. The drafter is proving marketable and at a most satisfactory price. The wagon horse is proving a favorite with the farmer. This is a horse weighing from 1,400 to 1,600 pounds and running from 15 to 16 hands. Another type proving a favorite is the "farm chunk," a horse running from 1,200 to 1,400 pounds. But in every case, nowadays, the demand is for pure blood of highest quality in the sires. To secure greatest efficiency modern equipment, especially a well fitting harness, is essential. Too few of the workers with horses understand the necessity for a perfect fitting collar and a harness resting lightly. Not all horses may have the beautiful dress shown above but there must be equal comfort.

A Pump without lubrication troubles

No lubrication troubles because there are no under-surface bearings to lubricate. The only lubrication required in the New Bean Turbine is in the head, where a radial thrust bearing operates in an oil bath. We have eliminated all drive shaft bearings through improved construction. The advantages of this construction are at once apparent.

Built in All Sizes from 6-inch up

The Bean Turbine goes into a bored well—or into your old pit, if you have one. It is suspended entirely from the surface—and can be easily removed when desired.

Efficient—Economical

This pump develops surprising efficiency and delivers the maximum of water at the minimum of cost. Requires little attention and the heavy substantial construction insures long and satisfactory service.

Send the coupon for Turbine Pump Bulletin—also, ask for catalog of Horizontal Pumps, if interested.

AT LAST!

A Non-Poisonous Spray That Equals Fumigation

After many months of patient labor and grievous disappointments the chemists of a Los Angeles Laboratory have successfully perfected a hydro-carbon oil emulsion spray which combines the effectiveness of fumigation with the economy and ease of spraying. It positively will not injure the most tender growths nor mar the beauty of bud or blossom. It is non-poisonous and non-inflammable and, what is very important, the component parts of the spray will not separate. The ingredients are of the purest and best and are so combined that the finished product will mix with water in all proportions.

This spray has been aptly named "FUMI-SPRAY" for this very good reason—for a considerable time after spraying fumes are

thrown off which act as effectively as direct contact of the liquid—thus every tiny crevice is FUMISPRAYED!

FUMISPRAY kills by contact and fumes the following parasites—Oyster Shell, Purple, Black, Red, Brown, Cottony Cushion and Scurfy Scales; Green, Black and Woolly Aphids; Thrips; Red Spider; White Fly, Pear Psylla and other forms of insect life.

FUMISPRAY is the last word in insecticides. Do not confuse it with any other spray on the market. We guarantee you satisfaction. Sold in large or small quantities. Write for prices.

One Dollar Yearly

Stockmen's Week a Big Event

By R. P. Royce

WITH the stage all set for what promised to be the greatest livestock gathering ever held in California

"Stockmen's Week" at the university farm, Davis, February 20-24, while in no sense a failure, fell considerably short of meeting the expectations of the members of the animal husbandry division and the various participating organizations. Just why this important event failed to gain the wide support it deserved at the hands of the livestock men of this state is not entirely clear. The weather, which was particularly nasty, was an important factor and the epidemic of influenza throughout the state undoubtedly operated to keep many away. But after giving due weight to the weather and the flu the fact remains that California ranchers and farmers were not present in numbers that the present situation or the excellent program merited. And one additional fact is certain: The very men and women who needed most the help suggestions and inspirations such meetings offer were conspicuous by their absence and for the most part their seats were occupied by men and women who had attended former sessions and who represent, if you please, the more progressive elements of our livestock husbandry—men and women who had come to an appreciation of the need and value of better methods and improved livestock in their operations. How to reach the thousands who are plodding along in the old ruts is the real problem that remains to be solved if these annual events are to occupy the important place in our agricultural affairs that they should.

California agriculture has not as yet reorganized on a peace basis. Too many of our producers are either in the depths of despair or are waiting in expectancy with the hope that some miracle of organized effort will make their business more profitable and too few have gotten their feet on solid ground and their minds made up to the recognition of the fact that the Lord helps those who help themselves—and in just the proportion to the thought and hard work that they put into their business, too many of our producers have their eyes fixed on increased prices for their livestock productions to the extent that they are overlooking the vital necessity of trimming their sails and shaping their operations to a basis of more economical production that can and will come through the use of better breeding material and more efficient management. It is to such men that these annual gatherings should bring inspiration and determination. Especially is this viewpoint needed at the present time by our livestock producers and general farmers. California agriculture must change in many ways during the next few years and nothing is more certain than that one change will be toward more livestock. We are not producing enough beef and pork to supply our needs; our dairy cattle are not producing enough milk and butter fat to justify land values in most dairy sections; we have a surplus of grains and hay and our soils are beginning to call for additional and available plant food. We cannot continue to produce grain crops for marketing for cash with competition from the world. With six to ten dollar alfalfa and cent and a quarter barley it ought not be necessary for this state to bring in 74 per cent of our pork and trainloads of cattle. That is the condition that is obtaining at present in this state and such meetings as were held at Davis last week should help to establish a different order—but they must receive the support of the public to a greater degree than was manifested last week if the situation is to change very rapidly. In short, California ranchers

need to develop a livestock consciousness.

The big features of the week were the various sales of registered cattle and swine and the annual dinner that was served Wednesday evening. The sales were fairly well attended and the values established, while low as compared to a year or two ago, offered cattlemen exceptional opportunities to secure breeding material at prices that make scrub sires look mighty high.

The opening session Monday afternoon was occupied with a meat cutting demonstration that sought to and did, prove the fallacy that heifers do not kill out as well as steers. An experienced butcher cut the carcasses and established a range of prices. He did a good job too—and managed to cut himself a profit that makes it all the more certain that the retail butcher is the nigger in the wood pile in matter of the cost of meat. Following the cutting, H. J. Baade, farm advisor of Napa County, explained the operation of fresh meat rings in that community. Under the plan used, details of which will be given later, Napa County farmers are able to enjoy fresh meat at a minimum cost.

Frank S. Hastings, manager of the great S. M. S. ranches of Texas was present on Tuesday and gave one of the most informative addresses ever listened to by California cattlemen. Hastings, who is regarded as one of the foremost authorities in America, has made a notable success in building up what is generally regarded as the greatest range herd in this country and the facts he placed before our producers were practical. Hastings gave it as his opinion that the cattle business has turned the corner and declared that there existed at the present time the heaviest demand for cattle—feeders and she stuff—that he had known in more than 20 years. Furthermore, he stated that there was a greater scarcity than for years and said that his own outfit, which annually markets about 15,000 head, was entirely sold out whereas last year they had carried over 4,000 head. Hastings urged that cattlemen adopt a definite program of improvement and while he laid great stress on the quality of the bulls he advocated a closer culling of the females as the only way of accumulating an efficient herd. The dominant thought of his entire talk, and the thought that should be studied by all cattlemen was this: "It pays to improve your herd, no matter how!"

H. C. Carr of Porterville, a banker who has always manifested a keen interest in livestock, urged cooperation on the part of the cattlemen. He declared that there was plenty of money available to finance legitimate livestock operations and that any banker who stated otherwise was, in effect, "talking through his hat."

At the close of the session, Chairman Ramsey asked those present to stand a moment in silent tribute to G. Howard Powell whose death occurred a few days before.

The afternoon was given over to the annual spring sale of the Pacific Coast Hereford Cattle Breeders' Association in which 67 head of bulls and females made a general average of \$165.

An evening program was arranged for the visiting stockmen and the student body. President Barrows of the university spoke of the importance of the livestock industry in this state and offered assurance that the university was in close sympathy with the industry and its problems. Dean Thos. F. Hunt of the college of agriculture reviewed the agricultural situation in Europe and pointed out

that in the recovery of Europe it was to their economic interest to produce as much of their food as possible. He also pointed out that such farm products as they imported must be paid for by the exportation of manufactured articles produced by cheap labor. If the United States expected to export quantities of foodstuffs we must be prepared to receive payment in cheap labor as represented in the manufactured articles which in turn would compete with our factories. Dr. Hunt made plain that in the end all countries must buy and sell on somewhere near a level.

During the evening Mr. Hastings, whose book "Recollections of a Rancher" has been recently published, talked in an extremely happy and entertaining way of many of his recollections. Hastings, by his practical accomplishments as a cowman, his charming personality and literary ability is representative of the highest type of men engaged in this great industry. He was "lionized" by the boys and at all times was surrounded by a group of eager students.

Wednesday concluded the activities arranged for the beef cattle men. During the morning session Professor True made a progress report on the extensive range cattle experiment being conducted in El Dorado County where the university owns a 2000 acre ranch near Shingle. The project contemplates to determine the practicability of developing a feeding industry in California; investigation of successful range management as regards breeding and handling the breeding herd and handling ranges. The herd has been divided into four units. From one unit the calves are brought to the university farm at weaning time in the fall to be fed out until marketed. A second unit furnishes yearling steers and the third unit furnishes two year old steers. The fourth unit consists of native range cows maintained at the university farm. Professor Howell gave some results from the feeding operations.

Wednesday afternoon the California Shorthorn Breeders' Association held its annual sale and sold 80 head of bulls and females for a general average of \$170.

Following the sale, the annual dinner was held in the university farm dining hall. More than 200 guests were at the tables.

Thursday was the "big day" and included meetings of the swine growers, dairy interests and wool growers.

The California Swine Breeders' Association elected Alex M. Wilson of Guasti president to succeed J. I. Thompson of Davis and Professor E. H. Hughes of the university was re-elected secretary. President Thompson called attention to the fact that the outlook for hog raisers was particularly promising at the present time and gave it as his opinion that there was more profit in hogs now than at any time during the past several years. Thompson declared that there were fewer hogs in California than had been for years and cited the fact that our markets were ruling higher than eastern markets due to the differential in freight rates. Thompson urged the breeders and producers to face the future with confidence and determination. He advocated an extension of and greater support to the farm bureau auctions: Increased exhibits in the barrow classes at the state fair and wider support to the local fairs and finally he stressed the necessity of the use of better boars.

Professor A. W. Oliver of the Oregon agricultural college explained the swine extension program in his state. He said that Oregon needed more

hogs and that the college was proposing to increase production on the basis of one hog to each of the 376,000 dairy cows; one hog to each ten acres of grain and one hog to each farm. Oliver also gave the results obtained in utilizing Oregon feeds.

Dr. Robert Jay, swine specialist of the United States department of agriculture who is stationed at Davis, extended his services to the swine interests of California.

Roy M. Filcher of Corcoran told of the success of the farm bureau auction plan of selling. Filcher was another to remark on the real shortage of hogs in California. He likewise urged farmers to raise more hogs and predicted that the market would continue satisfactory for the man who produces the right kind of hogs.

Professor E. H. Hughes gave the results of two recent rice feeding experiments at the university farm in which rice in various forms was fed. Space does not permit the detailed results but they will be published in subsequent issues.

Thursday afternoon 22 Poland China sows and gilts of excellent quality were sold at auction for an average of \$60.

The California Wool Growers held an important meeting the chief result of which was the adoption of a new constitution and the engaging of a paid secretary and fieldman to attend to the details of the association. For this work L. W. Wing, a graduate of the college of agriculture was secured. It is proposed to maintain headquarters at San Francisco and the principal activities of the new secretary will be directed along the lines of developing the spring lamb business in California. In this connection the association passed a strong resolution urging California sheep men to patronize the Wool Growers' Commission Company, a cooperative organization operating on the leading sheep markets.

There was a fair turnout of dairymen at the various meetings held on Thursday and Friday. Professor W. E. Tomson gave a report on the experimental feeding of sunflower silage at the university farm. His conclusions were that under ordinary conditions where corn and the sorghums could be satisfactorily grown that it would not be advisable to grow sunflowers. However, in the foothill regions it is possible that this new silage crop will prove of value as its feeding qualities are practically the same as corn silage.

The California Jersey Breeders' Association, the California Guernsey Breeders Association and the California Ayrshire Breeders' Association held business meetings Thursday afternoon.

Thursday evening was featured by the announcement of the winners in the state dairy cow competition that was conducted for 17 months, beginning September 1, 1920. During the competition 1260 cows from 64 herds were entered for prizes amounting to more than \$5,000. The detailed list of the winners will be given later.

B. H. Rawl of the California Central Creameries and Sam H. Greene, manager of the California Dairy Council, addressed the evening meeting. Mr. Rawl, who was former chief of the dairy division of the United States department of agriculture stressed the need of better cows and better methods in the scheme of economical production. Rawl pointed out the necessity of all factors in any dairy community working together inasmuch as the prosperity of the individual dairyman bears a direct relation to the prosperity of the community as a whole. He told of the splendid work in Humboldt county in replacing scrub bulls with pure bred

(Continued on page 246.)

Agricultural News Notes of the Pacific Coast

Northern California

Tehama County fair will be held September 11-17.

Colusa County fair will be held at Arbuckle, August 24-27.

Santa Rosa is making plans for celebration of its Rose Carnival in May.

There is reported to be more snow in the Sierra Nevada than for 20 years.

G. W. Harney has been reappointed county horticultural commissioner of Yuba County.

Sonoma County supervisors have called for bids for construction of the Pocket Canyon road.

Supervisors of Glenn County have appointed a farm home demonstrator in response to petitions by farm women.

The Sebastopol Apple Growers' Union will build additions to its packing plants at Forestville, Healdsburg and Stony Point.

The road between Dunsmuir and Weed in Siskiyou County was opened February 15. The roadbed was 14 inches of packed snow.

A modern fruit packing and cold storage house is being built on the university farm at Davis and will be ready for the fruit season.

Rominger Bros. of Sutter Basin say the wild geese have "sheeped off" their young barley, causing it to stool out and put forth better growth.

Electric lines of the Sacramento Northern Railroad Company, connecting with the Western Pacific, have been taken over by the Western Pacific.

Pomona Grange of Siskiyou has elected J. J. Murphy of Weed, master; Halbert Smith of Greenview, overseer; Mrs. Daisy Bray of Yreka, secretary; P. H. Lund of Hills, treasurer.

At its recent annual meeting at Sebastopol, Sonoma County, the Sebastopol Apple Growers' Association elected as directors E. C. Merritt, H. R. Harbine, D. D. Sinclair and J. H. King.

School consolidation, rural mail delivery and poultry and dairy improvement are the four major projects constituting the 1922 program of work adopted by Kenwood farm center of Sonoma County.

Manager Cable of the Sebastopol Apple Growers, who has spent the past seven years in the East as market director for the association, says that the eastern market can absorb 100 carloads more of loganberries.

The Shasta County fair association will be incorporated to make an annual feature of the fair at Anderson. The Intermountain fair will not incorporate but will be continued under management of the farm centers on the east side of the mountains.

On Saturday, February 4, the executive committee of the California Association of Nurserymen met at the Fairmont Hotel, San Francisco, to discuss nursery inspection and legislation. A second meeting is to be held in Los Angeles in about a month.

Fred C. Brosius, formerly horticultural commissioner of Sacramento County, has been appointed superintendent of nursery service, bureau of pest control of the state department of agriculture at Sacramento. He is succeeded by A. E. Morrison, deputy inspector of Sacramento County for four years.

Central California

Snow is six feet deep on the level in General Grant Park.

The Grange at Aromas, Monterey County, is building a new community hall.

Surveys are being made for the highway from Inyokern to Mojave and Los Angeles.

A new independent grape packing house is to be built at Orange Cove, Fresno County.

Storm waters flooded the state highway near Merced a foot deep during rains early in the week.

County Horticultural Commissioner Dixon of Inyo County has moved his offices from Big Pine to Independence.

Reedley cannery company's plant has been bought by the Anderson Barngrover Company of San Jose for \$125,000.

San Joaquin Valley choral association will hold its spring festival prior to Raisin Day, which will be observed on April 29.

Wm. T. Kirkman has purchased 400 acres of the Mordecia ranch southwest of Madera and will plant the entire holding to peaches.

Newly elected officers of the Atwater, Merced County, Fruit Exchange are: President, Chester Hull; vice president, R. C. Treanor; secretary, W. K. Worthen.

Daily airplane service is proposed between Bakersfield and Los Angeles. The distance is 108 miles by air, requires an hour and 20 minutes going, two hours returning.

The Kern County high school boys' agricultural club has shipped 20,000 Thompson Seedless grape rootings to farm bureau members of Casa Grande farm center, Arizona.

Bond election will be called within a few weeks for funds to purchase holdings of the Consolidated Canal Company at \$775,000 and sufficient more "to put canals in first class condition."

Permanent organization of the Raisin Day Festival association was effected at a luncheon at the Hotel Fresno, February 23, when representatives from organizations all over the valley met to discuss plans.

The Stanislaus County farm bureau cow testing association will discontinue taking of samples by members. At a recent meeting a new plan was adopted providing for taking of all test samples by Test Supervisor M. L. Gorow.

L. J. Weishaar, supervising inspector of the state department of agriculture, is at Delano attending a meeting of the lettuce and cantaloupe growers in that vicinity in order that these vegetables may be packed and inspected according to the grades which have been established.

Chester H. Rowell, for the state railroad commission, is holding hearing at Bakersfield of rate raise asked by the San Joaquin Light & Power Corporation. It was brought out during this hearing that the commission has no means of testing meters and current but relies on the company's tests.

A meeting of the attorneys representing the irrigation districts and land owners in the Pine Flat project, was held at San Francisco recently to prepare amendments to the water storage district laws. These amendments will provide for the irrigation district, as a unit, handling assessments levied against lands in the district.

Southern California

Ventura county fair will be held October 1-8.

The level of Lake Elsinore has been raised 12 feet by the rains of the past two months.

W. R. Schoonover of Alhambra has been appointed agriculture extension specialist in citriculture.

The Pasadena Horticultural Society will hold its spring flower show at Hotel Maryland, April 20-22.

Demonstrations of vine planting will be given by Prof. Bioletti at various points in the San Fernando Valley on March 9.

Banning, Riverside County, will be headquarters for a large crew of men who are ready to begin work on the state highway between Whitewater and Edom.

The Riverside farm bureau and the Riverside Business Men's Association are getting together on plans to organize an exchange to grade and market truck crops.

Spraying demonstrations will be held by the agricultural extension service in Los Angeles County at Lankershim and Van Nuys, March 6; Marion and Owensmouth, 7; Downey and Pomona, 9.

G. Harold Powell, for ten years manager of the California Fruit Growers, died suddenly of heart disease February 18, just after his return from the agricultural conference at Washington.

The La Habra Citrus Association has built 60 cottages for the use of orchard workers. A school is maintained for the colony where 100 children are taught in kindergarten and primary grades.

One of the most attractive features of the National Orange Show at San Bernardino is the by-products department, showing candies, vinegars, marmalades, jellies, etc., utilizing every part of the fruit.

More than 100 members of the Southern California Purebred Livestock Association enjoyed the barbecue given by the Oxnard chamber of commerce Saturday, February 11. Later a meeting was held at Berylwood Stock Farm.

In suit recently brought against citrus orchardist by fumigator to collect for work done, a Riverside judge found for plaintiff, setting aside claim of defendant that two rows of his trees had been seriously damaged by the fumigator.

Net returns from citrus fruit shipped out in ten months ending October 31, 1921, by the Orange County Fruit Exchange were \$6,056,892. This exchange ships fruit from the Santa Ana, Orange, El Modena, Olive, Tustin and Garden Grove districts.

The California Honey Producers Exchange is planning a reorganization which will eliminate many local associations and stabilize honey prices. Meetings are being held among bee-men in Orange, San Diego, Imperial and Riverside Counties.

In the contention between the state department of agriculture and some of the citrus growers of San Bernardino County, District Attorney Duckworth has announced as the policy of his office that it is not "advisable to issue a criminal complaint when evidence of frost injury in fruit has to depend on opinion of what condition the fruit might be in when it reached the market."

The Coast and General

Two wild bird sanctuaries have just been established on the lower Gulf coast of Texas.

American flour is said to be selling in Berlin at 1,250 to 1,300 marks per barrel while German flour of same quality sells for 1,400.

The Oregon State Beekeepers' Association at its meeting in Pendleton voted to affiliate with the American Honey Producers' League.

A new cannery equipped to pack clams, salmon and other sea foods and also berries will be opened March 1 in East Aberdeen, Washington.

Representative King of Illinois has introduced a bill in the house providing for the establishment of a bureau of farm insurance in the treasury department.

Mills to handle wool and mohair will be built by the Sheep and Goat Raisers' Association of Texas. Geo. M. Thurmond of Del Rio is secretary of the association.

Farmers of Douglas County, Washington, are planning to ship in 300 head of high grade Milking Shorthorns. This is part of a campaign to increase livestock in wheat lands.

The railroads have filed with the interstate commerce commission a plan for pooling the 2,500,000 freight cars of the country for the "joint use" by the railroads through one central agency.

The cooperative marketing bill has passed both houses of congress and is ready for the president's signature. This exempts farmers cooperative marketing organizations from provisions of anti-trust laws.

Development of great banana plantations in the Hawaiians is being taken up by Honolulu and Los Angeles capitalists. The opening of the new direct line to Los Angeles Harbor is said to have stimulated this project.

An advance of \$1 per hundred over the market price is being received by seven Multnomah County, Oregon, potato growers whose product passed final inspection for certification. The "lucky" seven were sifted from a list of six times that number who entered for certification.

The managing director of the Overseas Agricultural Development Company of Tokio, recently in San Francisco, declares that Brazil has given his company a 250,000 acre concession. Already 2,500 Japanese families have been located on these lands and intermarriage of Japanese and Brazilians is being countenanced by the government.

As a result of a conference at Eugene between representatives of the state board of horticulture, the forest service and Lane County officials to discuss the infestation of strawberry plants by nematodes in the coast counties, a complete survey of western Oregon was decided upon looking toward the eradication of the pest. The survey will be made under direction of the board of horticulture and Oregon agricultural college.

Dr. George F. Warren of Cornell University and William F. Candler of the bureau of markets and crop estimates have been selected by the secretary of agriculture to visit various countries of Europe immediately to develop methods and sources for securing crop and market information and to arrange for sending it more promptly to the United States, that farmers may use it in planning their seeding and in selling crops.

COOPERATION between the cattlemen, the railroads, the packers and the retailers constitutes the only possible constructive future policy for the cattle industry. This fact is firmly imbedded in the minds of the men whose accomplishments are most vital to the success of the livestock industry.

Success in selling is even more necessary than the development of volume in production, for volume in production is useless to the cattleman without some assurance of just profits, and this success in selling can come only through a proper development of cooperation all the way from the producer to the retailer.

Compiled statistics show what has been done; they show estimated supply and demand; the relationship between production and consumption as between countries; exchange values, and, in fact, all details concerning our industry. These statistics are necessary and essential, but they are without value unless we use them to develop cooperative action based upon definite and constructive lines.

Must Have a Hand

To form those plans upon a broad basis it is necessary that a definite and representative agency be established, and, when established, trusted. Whether or not the individual cattleman agrees with the policy of the representatives of the industry, or has joined forces with them, his success or failure will have its lasting influence upon the results obtained by those representatives, and, in turn, their success or failure will affect his own profit and loss account. For this reason, the cattleman must see to it that he is represented at the round table where the vital questions of the industry are at issue.

The American National Livestock Association is to be the representative body of the industry, with Fred H. Bixby the newly elected president. Bixby is not afraid of responsibility, but he cannot work without support. It is up to the cattleman to make known his wants—the wants of the entire industry—this in order that the president may do his part in procuring results comparable with those obtained in other cooperative industries. And in accomplishing these results it must be remembered that the American National Livestock Association is not a political organization. It is an organization to be used by the entire industry, and not for any individual or group. It is cooperative in the fullest sense of the word; its secretary and attorney are the only officers receiving compensation for their efforts.

Nevertheless, the association plays a vital part in the success of every man engaged in the industry. It is with the association that the packers, the railroads, the commission men, officials of the forest reserve, the reservation agencies, the retailers and the government take up the various phases in which they are separately interested. Each phase is presented to the association by the best talent obtainable in the various lines. These agencies will confer only with the chief representative of the association, and it is impracticable to ask them to do otherwise. For that reason, the chief executive of the association must have power to act. He must have the support of the industry all down the line.

Get Right, Then Stay Right

It is therefore absolutely necessary for every cow man to back his local organization; for every local organization to send its ablest representative to the county meetings; for each county to send its president to the state association, and for each state to confer freely with the national association. Then only will the cattleman get full results for his efforts.

Given a strong organization built up in this fashion, the industry will no longer have to limp along. It can stand on its own feet, and take care of its own problems.

In the long run, seeking financial aid from the government is not good business. It tends towards socialism, which never was, and never will be, a success.

At the present time, however, the War Finance Corporation is temporarily functioning to the benefit of the cattlemen in an endeavor to tide over the period of disruption follow-

ing the war. Under the stress of war, the government possibly was obliged to promote policies that have resulted in hardships to the stockman, and, in some cases, in disaster. Be that as it may, the government is now doing a wonderful work. It is loaning money for a period of one year, with privilege of renewal to all who are worthy, and the association is already seeking an extension of two additional years. At the same time, association representatives are even now in Washington endeavoring to procure equal financial rights with exporters and others who are seeking government advancement.

In time, however, the work of the War Finance Corporation will cease, and in the meantime machinery should be installed by the cattlemen themselves to carry on the work of this organization. But to install such machinery and to finance ourselves, the industry must be truly systematized. Cooperation must be efficient to be of value. And the creation of this cooperation is up to the individual members of the association. Once cooperation is efficient, the men who will represent the association, with the aid of bankers and local companies, will devise efficient means to finance the industry, and at that time the cattlemen should be able to stand as an organization able to finance its worthy members and secure just results from those handling and manufacturing the finished products.

Any one who buys on a low market and sells on a high market can work alone, but that is only a lucky point in the operation of business life and does not tend towards the stabilization of the industry. We must be able, through cooperation, to aid in the carrying of our own load just as the Raisin Growers and the Citrus Growers of California have turned their past failures into present success.

What Is the Real Situation?

Banks and loan companies have done their share in carrying heavy loads. True, it is that many have been increasing both their own burden and that of the cattleman in endeavoring to bring both ashore through rough water.

Banking laws regulate bank operation. When banks cannot fulfil obligations they are forced to close their doors. They are the pulse of the financial system. They handle the paper of loan companies. When they cease to do so, loan companies cease to operate. Most banks have had sad experience with cattle paper. It is up to all of us to rectify this feeling against our industry.

Admitted the producer is the man all the world is dependent upon, yet others also must have equal place in the progress of civilization.

Bankers are trustees of communities' funds. They are diagnosticians. They and their organizations are versed in business problems. They are prosperous when the public is prosperous. They are anxious for public welfare and individual success.

Experience has taught that great power in the hands of a few, when not properly exercised, often works disaster to those who have placed faith in the wrong man. Therefore, I sincerely believe that bankers must absolutely be a part of some suitable machinery set up to finance our industry. The commercial banks handle liquid transactions. This continual turnover enables them to assist all worthy producers in all walks of industry.

No Danger

Bankers must not apportion too great a part of the public credit to any given industry. Many borrowers of large amounts carry a commercial account of important size or leave on deposit with the bank from 10 to 20 per cent of the amount borrowed. If large concerns issue notes and sell them, they are sold through brokers, and these brokers charge a commission for the transaction—this explanation to prove that other producers pay in proportion to the cow man for their borrowed money.

The cow man is a producer. His business is never ending. He is married to it, no matter how future prospects develop; he can never slacken his efforts. Therefore, it is most essential that he be assured of a just return. As a rule, we in the livestock industry are poor detail business men. Our business is done a great deal on verbal agreement, and a vest pocket notebook is our usual set of books. If we are extended a loan, we take it all. For doing this we are required justly to pay more than 6 per cent, which in the aggregate equals what others are paying. We have been giving chattel mortgages on stock cattle—six months' paper—with the verbal promise of renewal.

Cattle Paper

Stock cattle paper is not commercial paper, because when drawn we know it will not be liquidated within the six months. If financial panics arise, the verbal promises of renewal are impossible. Cattle are unlike such commodities as grain, raisins or cotton. Absolutely different systems of disposing of same obtain in most sections. We have no uniform method of operating. Many of us cannot show our security. We do not keep accurate records of our business. Rumor may state that we are overstocked, and we cannot disprove this except during the best feed season of the year. With all of these handicaps, we must interview the banker. We want assistance, and we must have it to continue.

We should and must be the men to set up the proper machinery of financing. If it takes one year to get a steer and three years is his average life, and it takes a year in advance to prepare for efficient operation, it will take at least four or five years to operate successfully. With this length of time, our cow judgment could be used without the ever present thought of liquidation at the end of six months.

Operation of the Open Range

The man who must feed his cattle through the severe months of winter must keep a close check on his herd.

The open range man of the southern states checks his cattle by calf brandings, yearling steer sales, and records of death loss. Being optimistic, he is inclined to exaggerate the ability of a cow and the carrying capacity of his range. This honest exaggeration is spelling ruin. The cattleman's final answer is always derived from his calves; not from what he thinks he branded, but from the number turned into money. His inventory of cattle is increased by the corresponding number of heifers left on the range. He must be sure that this heifer increase is not overstocking his range capacity. The average man, under fence, does not exceed 75 per cent calf crop, more often 60 per cent.

The best records and information show 50 per cent calf crop on open range to be exceptionally good. During the years of increasing yearling values up to 1920, the calf crops had been decreasing, and I doubt if the net revenues of 1920 were greater than those of 1916.

Remember that the \$40 average yearling never made money for the man who finished with him. Meanwhile, the cattleman's overhead had been increased from 150 to 200 per cent. At the present time this overhead is steadily decreasing. I personally had the opportunity of checking a few open range operations, and the calves sold are invariably short of 50 per cent of the breeding cows. The two year old steers representing last year's yearlings never materialize to equal the 50 per cent. To insure success, calves must be produced.

Shortage of calves comes either from lack of bulls or lack of feed to keep the cows in calf producing condition.

Breed Up

Just a word about bulls. The production in the average herd of pure breds brings about 10 per cent super animals, 50 per cent of No. 1 specimens and 40 per cent which should be used for beef purposes. Therefore, in purchasing bulls the producer must be sure of the breed-

ing, then pick his individuals to build up that quality which his herd lacks. He must bear in mind that standard range cattle of today were built up by the reproduction of individuals of the best type. Figure the cattle business on a percentage basis. If borrowed money is costing 8 per cent, taxes 2 per cent, operating expense 3 per cent, the cattleman will have to make 13 per cent before he breaks even. If he is getting only 35 per cent calf crop figuring over a period of years, how can he achieve success?

The Market Outlook

Since the operation of the War Finance Corporation, courage has returned to the livestock producer. He is not now being forced to liquidate. Cows are not easily purchased. It is safe to say that range cows have increased in value from \$5 to \$10 per head in the past 30 days.

The western states are short of cattle. Information states that the Denver market will be about 40 per cent short this spring. Because Denver is a great cow market, and there is a shortage of cows, the market on range breeding cows will be further stimulated. The Ogden market is for the present cleaned up, with very few cattle in that territory on feed. Nevada has not over 50,000 cattle on feed, with buyers very active. The supply is away below normal. All markets on the Pacific Coast are active and showing increased values. These facts are all encouraging, because they show us that we can count on the markets acting in their normal way.

The supply for the big eastern markets in the so-called "corn belt" is reported normal. The supply for the past season was about 16 per cent short, while the feeders being prepared for beef purposes are only 14 per cent below normal. The demand for beef is below normal. Therefore, the supply will be adequate to the demand, and we cannot expect any extraordinary prices for fat steers. Without doubt the eastern markets will show a steady increase until they reach their high point in June. When these normal conditions arrive, high freight rates and heavy shrinkage will prohibit eastern cattle flooding our western markets.

Wait a Long Time—Meantime Starve!

We cannot look for accelerated war prices. Remember that the producer was the first to sell at pre-war prices and that other commodities and operating expenses must now seek their normal level. Not until they do will the producer enjoy a fair return for his efforts. South America has more supply than can be handled at present. Canada is reported well provided with beef cattle. If the steer market rises to anything like prohibitory prices, foreign supplies will automatically have their effect in the old economic law of supply and demand, regardless of import duties.

Cattle of milk producing strain comprise 50 per cent of the total cattle of the United States and are a big contender in the supply of feed and veal. They find their way through the smaller slaughter house and country butcher, where health inspection certificates are not standardized to federal inspection.

This meat is in competition with beef from animals bred, raised and fattened for strictly food purposes, where the betterment of the food values is advanced just as the milk-producing quality is sought in the milk animal. Is the distribution of this meat to the uneducated public a good advertisement?

John Clay, president of one of the largest livestock business firms in the world, has been a student of our industry for more than 40 years. He now admits that he has a great deal to learn. That applies to all of us.

Look back over your experience. Increased values in stock farms and ranches have made riches. Some speculators have been successful, but how many do you know who have become independent through the actual raising and finishing of beef cattle?

I believe it is low tide; that all should build machinery at home which will have its place in the set-up of financing, distribution, advancement and cooperation; when the tide rises it will be in the form "Success." It is up to you to cooperate.

Think it over.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

One reason why the Cultivator has not used more cover illustrations featuring draft horses has been the extreme difficulty in securing creditable pictures due to the lack of interest our ranchers have manifested in the horse business of late. There is no question but that the production of draft horses has been restricted to a point where it is well nigh impossible to go into any community and gather a carload of marketable stock. There is now a very definite trend throughout the farming regions of the United States toward reestablishing the horse breeding industry. Careful investigations are developing the fact that under average conditions both the horse and the tractor have important parts to play and that it is a mistake for farmers to depend upon either source of power to the exclusion of the other. The fact that good sound draft horses of correct stamp have suffered less depreciation than has been registered by other farm products has caused many men to do some serious thinking. Unfortunately, this revival of interest will not be noticed for at least five or six years and in the meantime the scarcity of suitable types will become more acute.

Irrigators, more especially irrigation equipment people, are to hold an

important meeting at Fresno next Saturday, March 11. The equipment people consider their problems important enough to justify the organization of the Western Irrigation Equipment Association. One of the members writes us: "Since the formation of our association there has been a tendency, with definite plans to that end, to supply the farmer with irrigation equipment that is particularly fitted to his needs. In fact the principal object of our association is to study the needs and then equip to meet those needs. We are already accomplishing things along that line."

DAVIS' REPORT SIGNED

Secretary of the Interior Fall has signed and transmitted to congress the report of Arthur P. Davis on the Colorado River. This report is the result of extensive surveys begun by the reclamation service months ago. This report has been in hand for some months but owing to the vastness of the enterprise with which it deals has taken a long time to get entirely ready for congress. Information as to the signing and transmission comes to California through telegraphic advice sent Imperial Valley irrigators in session last Tuesday.

REAL COOPERATION NEEDED

This issue of the California Cultivator runs rather largely to livestock matters. Still more, it runs largely to cooperation in livestock marketing. The article on the fifth page (229) "The Cattle Situation" is written by William E. Hough of the First National Bank of Los Angeles. Another article written by one who has observed recent cattle marketing conditions at a somewhat different angle writes "Wanted—An Agrarian Moses." This writer is Mr. Spellmeyer who has furnished several articles in recent Cultivators. We hope this article will be read by both livestock men and fruit growers. We believe many cattlemen and producers generally will join Mr. Hough in his statement in the first paragraph,

"Cooperation constitutes the only possible constructive future policy for the cattle industry." The cattlemen also believe that the cooperation should not be one sided but participated in by railroads, packers, retailers, consumers and bankers. The cattlemen feel that with the past two years as an example the "cooperation" has been exclusively on the part of the producer. It may be that he is embittered by the fact that he has been financially ruined while many large interests which have dealt in his product have succeeded and greatly increased wealth. In other words the farmer has borne the brunt of reconstruction.

The farmer is not carrying the idea that the railroads or larger interests are being borne on flowery beds of ease while the farmer only is suffering. But the farmer does not believe, as does Mr. Hough, that "banks and loan companies have done their share in carrying heavy loads"—not all banks at least—nor do they believe that the railroads have done their share in helping the farmer get to market with products which have cost him in many cases all he had in the world to produce.

Tens of thousands of farmers and stockmen are today financially ruined, "and when letters come to the Cultivator from former well-to-do subscribers, stating that their banks have refused to secure them 7½ per cent money from the war finance corporation, demanding instead 10 or 11 per cent, and that they cannot afford to ship out their feeder cattle nor bring in feedstuffs to condition them—because of transportation rates—they wonder if the only thing they can do is to accept the inevitable and give up. When they give up, just to that extent does every other industry slump. There is no getting away from that fact. It is a trite saying that "agriculture is the basic industry," but it is as true as that the sun is the source of heat. As H. P. Hovland puts it:

"The first layer of industry lies next to the soil, in agriculture, and it is the thickest layer and the layer of

greatest magnitude. Layers of other industry lie over agriculture in successively diminishing magnitude. Agriculture has been, is, and will be, the most important industrial layer in the Southwest, as elsewhere. Thus it is a simple mental process to perceive that agriculture should not be neglected—for if the outcome be satisfactory to agriculture it must of necessity be satisfactory to all other industries inasmuch as all other industries rest on agriculture."

THE QUARANTINE

A Santa Clara Valley fruit grower recently went to the Hawaiian Islands and investigated fruit growing conditions, particularly the effect of the Mediterranean fruit fly on the industry. He was thoroughly frightened and, returning, observed that the force of quarantine inspectors and officials maintained in California ports was not sufficient to assure immunity from the dreaded pest. He appealed at once to Director of Agriculture Hecke to increase the number of men engaged in the inspection service. He said: "The quarantine force here must be augmented immediately. The small force of inspectors at San Francisco, while doing excellent work, is not adequate to cope with this serious pest, and I will recommend that the fruit growers demand more inspectors and the appropriation of a state fund for the thorough enforcement of quarantine regulations. The situation is replete with danger. We have hundreds of millions of dollars at stake and the state must protect this great industry." This gentleman is V. T. McCurdy, chairman of a committee appointed by the Federation of American Farmers to investigate fruit fly conditions in the Hawaiian Islands.

Mr. McCurdy is not condemning methods, nor is he charging inefficiency, but he is appealing for a sufficient force of inspectors to keep closed every avenue of entrance. Quarantine Officer Strong finds the situation complicated by the fact that the ports of the Pacific are not the only ones

U. S. MOTORS

---dependable 40° motors
---irrigation type

The greatest need for irrigation is in the hottest part of Summer. The motor you use must be capable of operating at high efficiency without danger of overheating. U. S. Motors, irrigation type, are built to meet this need. They are the big, sturdy 40° type recommended by irrigation engineers. Study the advanced constructional features of U. S. Motors. Learn why they excel in the West. Send for literature and make your installation now, before irrigation season begins.

Horizontal and vertical types,
all speeds and voltages, for
all farm power needs.

which need watching, nor is the fruit fly the only pest. There is need of a force even greater than the one now possible watching the roads coming over the tops of the Sierra Nevada and keeping out the alfalfa weevil. So east and west, north and south, insect pests and fungus pests all have to be taken into account in the fight to protect the California fruit growing industry. It is a long time before the legislature will meet and strengthen the hands of the state's guardians by making sufficient appropriation, but some means should be provided in the present emergency.

WATER AND POWER ACT

The State Irrigation Association, an organization for promoting the Marshall plan, seems to have squarely allied itself with the interests. We have a circular letter without date and not addressed to anyone but signed by Barlow, president, in which he says that "Neither Col. Marshall nor the California State Irrigation Association is backing the Kent-Spreckels scheme, Townlyism, as experienced in Dakota, nor Leninism as enjoyed by the people of Russia." It is too bad to have the Colonel so intensely opposed to the best interests of the people. The Colonel dreamed a great dream. It may not have been practical but the Cultivator had hoped something might come entirely worthy of the greatness of this state, but his effort now seems to be to drive away those who might have been supporters of at least the best part of his plan.

WORK HARD

There is a lot of good advice being sent around these days which consists, at least principally, of two words, "work hard." It is a part of the thrift campaign of the treasury department, part of the campaign of many commercial clubs, roll top advisers and others. We would not carry the idea that hard work is not performed by the man in front of the roll top desk; some of the hardest, most grilling, most killing of all work may be performed there. But as much of the advice has been addressed to that hardest working man on earth—the farmer—we feel it but just to say that the farmer who is putting in from 12 to 16 hours a day and taking chances with the weather, the markets, transportation and a few other hard problems is entitled to a fighting chance to get by with rather better compensation than is possible with today's condition. The farmer has taken the brunt of the reconstruction costs, and the worst of it is there is a general inclination to allow him to continue to shoulder the load. A little more of a chance to get the produce to the market so as to leave a living wage would be a godsend at this particular moment. Unfortunately the railway companies do not seem to think it advisable, and the railway and commerce commissions do not appreciate the necessity of protecting the farmer's capital as they do the necessity of protecting capital invested in railroads.

As stated by the Monitor of Boston: "While the representatives of many important producing industries have been inclined to content themselves with the precarious profits of a season of unavoidable depression, the insistent demand of railroad managers and the representatives of investors in railroad securities has been for the fullest possible return upon their service and investments. There has been expressed the unavoidable conviction that the railroads have not done their part in bringing about industrial readjustment. They have demanded the right to exact higher freight rates while insisting upon a lower standard of wages for their employees. Stubborn resistance has been made to a general demand for lower traffic rates, producers, especially in the agricultural districts, complaining that the cost of transportation in many instances made the marketing of their crops prohibitive. It has been pointed out that the railroads might lend a helping hand in the present emergency by making appreciable reductions in commodity freight rates. But it may reasonably be insisted that the railroads, if only as an evidence of good faith, should show their willingness to cooperate whenever and wherever possible."

KIRKMAN NURSERIES

This Orchard Yields an Average Income of Six
Hundred Dollars per Acre

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

OUR EXPERIENCE

has been gained through thirty-two years of progression in the nursery and orchard business in California.

WE OFFER OUR SERVICES

in undertaking the planting and care of commercial orchards for prospective owners desiring a profitable orchard or vineyard without undertaking the improvement work. We will furnish the land and bring it into bearing under the guarantee that it will be PROFITABLE, or ALL MONEY invested will be returned to the customer with interest. The payments made by customers constitute a first lien on each subdivision tract. If every property becomes highly profitable as we plan all customers will take heed. If for any reason some of them should prove to be only fairly remunerative the customer has not taken a greater hazard than to make a safe real estate loan.

We have been growing orchards for others in conjunction with our nursery business for several years. ALL of these have been profitable to our customers. We are now in a position to serve those interested in high class income properties to the best advantage. Lands already secured for this purpose are situated at strategic locations on or very near paved highways and the very best of soils that can be secured regardless of cost. We now have growing or in the course of improvement a total of sixteen hundred acres, including considerable plantings of Thompson Seedless, Malaga, Emperor and Muscat Vines, also canning and drying peaches, apricots, plums, prunes and figs, including one of the finest young Kadota orchards in the state. These plantings are in Kern, Tulare, Madera, Contra Costa and Merced Counties, adjacent to thriving towns, modern schools, etc. We are willing to put our money in with our customers and safeguard him against any possibility of a loss. Our part of the investment and our profit comes out of the crops of the properties. Details and location of properties on application.

TREES AND VINES

for everybody. Send for our descriptive price catalog.

Awake to the Menace Confronting American Agriculture

DURING the early part of June plat quarantine, pest control and standardization matters capital importance to California and the entire West will be discussed in Sacramento by county, state and federal officials from all western states and from Washington, D. C. There will also be represented officials from Hawaii, British Columbia, and the Northern District of Lower California.

G. H. Hecke, director of agriculture, has called a meeting of the executive heads of all western departments of agriculture and commissions of horticulture to form an organization for the protection and development of agriculture in the West and to support the federal government in its efforts to do those things for agriculture in general which should of necessity be done. The county horticultural commissioners will also be called together at this time in their annual spring convention. The western plant quarantine board, an organization composed of the plant quarantine officers of the eleven western states, Hawaii, British Columbia, and the northern district of Lower California, will meet at this time in its Fourth Annual Conference. This organization is formed for the purpose of protecting the West against insect pests and plant diseases which are not yet established west of the Rocky Mountains and to work toward uniform enforcement of plant quarantine regulations. The federal horticultural board, the national quarantine enforcement body, will meet with the western plant quarantine board and the western departments of agriculture.

There are many important problems to come before the meetings. The alfalfa weevil has become established in Washoe County, Nevada, and to prevent its further spread in Nevada and to guard against its introduction into California calls for extreme effort. All freight shipments and all automobile traffic out of or through the infested area must be closely watched. It is hoped to secure federal aid in this work. The Mediterranean fruit fly and the melon fly established in Hawaii, and the Mexican fruit fly established in Mexico and Central America constantly menace the fruit industry of the entire West. The federal horticultural board during attendance at the meetings in Sacramento will hold a public hearing on these questions. Members of the Federation of American Farmers will be present at the meetings to urge more stringent quarantine measures against

the fruit flies. The committee representing the federation and several fruit growing associations have recently returned from Hawaii where an investigation of the Mediterranean fruit fly and melon fly was made. The chairman of the committee, V. T. McCurdy of Santa Clara, states, "The quarantine regulations here must be augmented immediately. The small force of inspectors at San Francisco, while doing excellent work, is not adequate to cope with the serious pest, and I will recommend that the fruit growers demand more inspectors and the appropriation of a large state fund for the enforcement of quarantine regulations. The situation is replete with danger. We have hundreds of millions of dollars at stake, and the state must protect this great industry."

The farmers and fruit growers of the West will be invited to attend the Sacramento meetings and to bring before the quarantine officials and the heads of the departments of agriculture such problems as they may think necessary.

White pine blister rust will also be given consideration. This disease was introduced into the eastern states from Europe and was first found at Geneva, New York, in 1906, on currants. The source of the disease was found near by on white pines. Later other sections of infection were discovered. The disease affects all five-leaf pines and finally kills the attacked trees or parts of trees by girdling the stem or branches or twigs infected. If the trees are attacked while relatively young, it is extremely likely that the entire tree will be killed. In older trees the branches and commonly the top center shoot may be attacked and killed. In this way the disease may kill the largest tree. White pine blister rust has recently been discovered in British Columbia and in the northwestern part of the State of Washington. A bill has been introduced in congress appropriating \$150,000 for white pine blister rust control in the Northwest. At a conference held in Portland, Oregon, in December, 1921, an executive committee was appointed to outline and to put into effect measures for the eradication and control of this disease in the Northwest. This executive committee will be present at the meetings in Sacramento in June.

It is sincerely hoped that all interested farmers and fruit growers will be in Sacramento to attend the public hearing on quarantine matters to be called by the federal horticultural board. The definite date of the meetings will be announced.

The Present Fertilizer Situation

By C. S. Milliken

IN 1912 the experiment station at Riverside called the attention of citrus fruit growers to the importance of supplying their orchards with humus making materials. That the industry as a whole was impressed with the soundness of their advice was demonstrated by the increased demand for barnyard manures and by the increased planting of cover crops.

The importance of supplying humus to the soil is probably greater today than it was in 1912. With the increase in citrus acreage during the last ten years and a steady decrease of local manure supply, coupled with the fact that many of the outlying accumulations on which we formerly drew are now exhausted, the industry will be forced onto a daily production basis even by a much smaller demand than we have had in past years. An increased demand will mean an inadequate supply and increasing prices, with growers bidding against one another as in the past.

Anyone making a study of the fertilizer conditions of the country at this time cannot help but be impressed by the fact that radical changes are now taking place, both as regards the production of fertilizer materials and their distribution. Many materials which in the past have been used al-

most exclusively for fertilizer purposes are now being diverted into other channels and consumed in other uses.

In a very few years high grade organic fertilizers such as blood, tankage, cottonseed meal, etc., may be practically unobtainable for fertilizer purposes. This may happen at any time. The only thing that prevented its happening this year was the supply obtained from South America, which supply will undoubtedly flow back into its old channels of consumption on the eastern seaboard, to Cuba and to England.

High grade tankage today is practically off the market in Chicago. Several of the large meat packers are reported as buyers instead of sellers. These materials are now being consumed in increasing quantities in the manufacture of stock foods. Their use for that purpose is far saner than their direct use for fertilizers.

The nitrogenous fertilizers of the future, and it may be a very near future, except for the barnyard manures and cover crops, will be those containing high percentages of nitrogen, such as ammonium sulphate, sodium nitrate, ammonium nitrate, and products from the air nitrogen plants, of which calcium nitrate is one. The high percentage of nitrogen which these substances contain will allow them to be

50th Anniversary Montgomery Ward & Co.

MONTGOMERY WARD AND GEORGE R. THORNE

started business under the name of: "Montgomery Ward & Co." in 1872. Mr. Ward had been a clerk in a small town store, with farmers as his customers, farmers as his friends. And so he conceived the idea of helping save the farmer from paying three or four profits by selling him goods direct by mail at one small profit. With a capital of less than \$2,000 they issued their first little one-page leaflets, and so began this vast business of Montgomery Ward & Co.

In 1874 the first catalogue of Montgomery Ward & Co. was issued. It contained eight pages, about three by five inches in size. Today this 50th Anniversary Catalogue, this 1922 Price Guide, shows about everything for the Home, Farm, and Family—new, fresh merchandise of standard quality always, with every price based upon today's low costs of production.

If you have a copy of this book, buy from it regularly. It always brings you a saving. And lend this book to your neighbors. Let your neighbor take advantage of the cash saving it always offers.

The Oldest Mail Order House is Today the Most Progressive

FOR FIFTY YEARS the American Farmer and Montgomery Ward & Co. have been helping each other.

For Fifty Years we have worked conscientiously always to offer you a saving. And you, by your appreciation, by your patronage, have built this business, until today we have five million customers.

And there is the proof of the saving and the service Montgomery Ward & Co. have rendered to the public. No business that is not sound can weather the storms of fifty years. No business that does not render a genuine service can win the patronage of five million people.

Our big 50th Anniversary Catalogue, pictured below, adds greatly to the sum of all our past achievement in making low prices. This book is today a Price Guide, sets the low price standard for America, and tells you the right price, the price you should pay for almost everything you buy.

This book shows the new-old spirit of Ward's—progressive, alert, working to give lower prices, to give you bigger and bigger values, and better and still better service—and always under the Banner of the Golden Rule.

TO THE AMERICAN FARMER:

Let Us All Pull Together

We know business conditions on the Farms of America, as well as in the towns and cities. We have customers everywhere. We believe the worst is behind us and we are hopeful and encouraged. But we are all in the same boat. We must all pull together. We are going to do our part with you. This season you will need some new tillage tools to replace those that are worn out. We are going to furnish them without one cent of profit to us.

Our Tillage Tools Sold Without Profit

The prices on Tillage Tools in our 50th Anniversary Catalogue are absolutely no-profit-prices. Many items are priced at less than we can replace them for today. And the prices all through this book have been made to meet present-day conditions. At Montgomery Ward & Co. we feel we owe a duty to our customers—to help make prices come down. We are in the same business boat with all of you. Let us all pull together. We are doing our part.

MONTGOMERY WARD & CO.

Kansas City Chicago Fort Worth
St. Paul Portland, Ore.

shipped long distances without making the cost per unit of nitrogen prohibitive.

When this condition comes about the use of manures and of cover crops will assume a far greater importance than has ever existed in the past.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dwarf Apple Trees

Please let me know through your paper what kind of stock is used to produce dwarf apple trees. Can it be procured here? I anticipate planting some at Trapat, Mexico, elevation 5,000 feet. We have plenty of water for irrigation and the rainfall is 25 inches. The rain comes in summer and the winter and spring are dry.—H. F. A., Oakland.

We believe that the citrus fruit growers should consider this matter seriously and, if in a position to secure from any source of supply a good quality of manure at satisfactory prices, should arrange for liberal applications during the coming year.

We would advise consulting your nearest large tree nursery for supply of Paradise stock. The question submitted to the largest propagator of dwarf apple trees in the South brings the following: "We have used what is known as 'Paradise root' from France. The great difficulty in propagating trees on this root is that they invariably have root knot and hairy root, which makes it almost impossible to ship the trees in California where we have a rigid inspection system. Hence we have discontinued propagating such stock although we have a few trees this year, but cannot attempt to send them out. We

would think that trees propagated on ordinary apple stock would be best for the situation you mention."

Killing Bermuda

Is there anything I can apply to Bermuda grass patches to kill it or does it have to be done by cultivation? The patches are not large, but it continues to spread.—Subscriber, Biggs.

Practically the only way of killing Bermuda grass is thorough cultivation. There are chemicals, such as arsenic, even kerosene, bichloride of mercury and others which work fairly satisfactorily if economy is not a consideration, but for effective eradication of Bermuda grass the hoe, spade or cultivator are best.

Loss of Organic Nitrogen

What effect would the rain and other weather conditions have on a commercial fertilizer containing 5 per cent organic nitrogen, spread broadcast around the trees in a citrus grove and left on top of the ground because the rain made the soil too wet to plow or

disk? Would some of the nitrogen, derived from blood, bone and tankage, be lost if the fertilizer were left uncovered for two weeks? What would be the best method of applying commercial fertilizer, 25 pounds per tree, in a citrus grove?—Subscriber, Woodlake.

We think there would be no loss of nitrogen from fertilizer spread as suggested, though there would be if left in piles and allowed to become moist and heat. If inorganic or one of the nitrates had been used then the rain would have leached and seriously lowered fertility. We take it that if thinly spread over the soil later cultivation would simply put it under and make it available.

Planting Orchard

I have a piece of good sandy loam soil with a medium stand of alfalfa on it. Having had no experience with alfalfa, am asking if I can get it in shape to plant a family orchard this spring? If so, how should I proceed? What distance apart should trees of a mixed variety be planted and how late can I plant for results?—Subscriber, Lomita.

The first step in planting the family orchard on this plot would be deep plowing followed by such leveling as may be necessary to permit of irrigation. Smoothing or harrowing should be followed by laying out and setting a stake where each tree is to come. This is usually done by stretching strong cords or wires on which are tied or soldered tags every 20 feet, or the distance preferred. In the family orchard it is not possible to name uniform distance for all trees, while pomegranates, quinces or similar dwarfs might be set 10 feet apart, walnuts should be set 60 feet apart. But, as a fair average, presumably 20 feet would meet requirements. The holes should be dug and all deciduous trees planted at once. Trees are already sending out little rootlets for the new season's growth and every day's delay makes for less certain results. Planting of citrus trees or other subtropicals may be delayed until as late as June if desired.

Locating Ex-Service Men

I have a young friend who went into the army during the war and am anxious to learn where he may be. Is there a department of the government which will help me locate him?—Subscriber, Bakersfield.

Write Department of War, Washington, D. C., giving name, regiment and all particulars possible and it is probable you may get in touch with him through some branch of the department.

Root Knot or Crown Gall

I am enclosing for your examination a specimen of a formation that was taken from the roots of a persimmon tree that I had occasion to move recently. I would be pleased to have your opinion as to the cause of this condition and whether or not it would be detrimental to the tree.—Subscriber, Arcadia.

This is a plain case of root knot or practically the same trouble as the crown gall which causes the death of vast numbers of persimmon and other trees. Nursery trees which are affected are always rejected, for there is practically no help for the tree seriously infected with this pest. Spores of this trouble are present in many of the soils of California and roots injured by cultivator may become inoculated, the bearing capacity of the tree affected and the tree eventually killed.

Silo for Ten Cows

Kindly let me know how big a silo should be for a little dairy farm of ten cows.—Subscriber, Alta Loma.

Ten feet in diameter by, say, 30 feet high. The silo should be of a size which permits feeding down about two inches daily which will keep the entire surface from spoiling. The daily allowance commonly fed ranges from 20 to 40 pounds per thousand pounds of live weight of the animals fed.

Mineral Matter for Cow

Will you please advise me through your columns as to feeding mineral matter to dairy cattle, what to feed, in what quantities, and where the mate-

John Deere No. 26 Orchard Tractor Disc Plow

Three-Purpose Plow

For Plowing, Subsoiling, Irrigating in Orchards

YOUR equipment investment is greatly reduced—you plow, you subsoil, and you ridge for irrigation, all with one implement and all with the power of a small tractor—when you use the

John Deere No. 26

The 3-in-1 Plow

Unusually low and narrow. It is only twenty-six inches high when plowing six inches deep, and only thirty-seven inches wide—gets under low limbs and up close to row.

Stiff, adjustable hitch—a great disc-plow improvement—permits offsetting plow to right or left of tractor for work close to row, and, being stiff, it tends to hold the plow in the furrow, when offset.

Floating rear end—loosening the set-screw collar on the rear axle permits rear of plow to rise over roots without carrying weight of rear wheel—a great aid in preventing damage to large roots.

Compound power lift raises discs unusually high. Frame built

over discs, providing unusual clearance. Discs and disc bearings same as on large John Deere disc plows.

If you own a small tractor or plan to buy one, you can save money on your equipment investment and make the extra profits that come from better orchard cultivation by doing your plowing, your subsoiling and your ridging for irrigation, all with this John Deere three-in-one implement.

Ask your John Deere dealer to show you this plow. Write to us for a free folder describing it. Drop us a post card today.

John Deere Plow Co.
San Francisco, Cal.

John Deere No. 45-A

The No. 45-A is an unusually light-draft, two-bottom moldboard plow built for orchard plowing with small tractors. Low and narrow like the No. 26—only twenty-six inches high when plowing six inches deep—only thirty-seven inches wide—levers set low when plowing—gets under the low limbs up close to row. Adjustable hitch permits offsetting for work close to row. Great strength—

beams guaranteed not to bend or break. Compound power lift raises bottoms unusually high. Great clearance to prevent clogging in cover crops. See it at your John Deere dealer's. Drop us a post card today, asking for free booklet describing it fully.

John Deere No. 45-A Orchard Tractor Plow

Showing subsoiler equipment. Replaces one disc. Controlled by power lift. Breaks up plow pan and forms deep bed of aerated mulch, thus saving much irrigating water and greatly increasing crop yield. Permits plowing and subsoiling in one operation with small tractor. Be sure to get acquainted with this thoroughworking, inexpensive equipment.

Showing No. 26 preparing soil for proper irrigation with ridging equipment. Makes buying extra machine unnecessary. Power lift and guiding advantages are retained when the plow is used for ridging. This equipment is a real money-maker, and it costs but little.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

rials are to be obtained, also the literature of the subject, and what the experiment stations have reported or are working on along these lines?—Subscriber, Raisin.

No animal can live without "mineral matter." Perhaps the best information along this line is to be had in Woll's "Productive Feeding of Farm Animals" published by Lippincott, Philadelphia, and Henry's "Feeds and Feeding" published by Henry & Morrison, Madison, Wisconsin. Henry's "Feeds and Feeding" says: "It is probable that, by reason of its perfection, the animal organism is able to use many of the mineral substances over

and over for the same functions, taking them back into the circulation again after they have once been used. In spite of this frugal economy, however, losses of mineral matter from the body constantly occur, even during starvation. Ordinarily the rations of farm animals contain all the necessary mineral matters, at least in small quantities, and since the body retains them with great tenacity when the supply is meager, these small amounts usually suffice, especially for mature animals. Common salt, calcium (lime) and phosphorus are often needed in such large amounts that they may fall short in certain rations, and hence must be added, if normal results are to be obtained. Young growing animals require larger supplies of mineral matter than those which are full grown; hence more care should be taken to provide a liberal allowance, especially of lime and phosphorus." As may be seen from the quotation from Prof. Henry the ordinary feed in the well balanced ration contains sufficient mineral matter. However, a supply of salt available to the animals at all times is desirable and some feeders go so far as to have finely powdered bone meal before the animals. Hogs, however, usually demand more minerals and hog feeders as a rule keep before the animals mineral mixtures, formulas for which have been given in recent Cultivators.

Nematodes

I am sending some diseased roots from Australian spinach. The disease seems to dwarf the plant. It has affected all the vegetables in my garden and seems to be in the soil.—Subscriber, Escondido.

These roots were so dry that it was impossible to determine their exact condition other than that they were badly infested with nematodes. This pest is probably responsible for the failure of the plant. How to eradicate it and make infested grounds productive is one of the big problems before scientists and practical agriculturists. It is said that the application of 300 or 400 pounds of nitrate of soda per acre is beneficial.

Pure Food and Feeds

Kindly let us know if there is any place to have feed tested. We are paying the highest price for good feed and find pine sticks, bark, brown paper, etc., ground up with it. We refer to coconut meal and dairy feed.—Subscriber, Hynes.

Write Pure Food and Drug Laboratory, Attention Mr. Lee, University Campus, Berkeley, and it is probable you can secure information as to the real value of your feeds. In any case there is a state law the intent of which is to prevent adulteration and the maintaining of a standard in foods and feeds.

THE RUSSIAN FAMINE

In the fall of 1920 the farmers of the Volga Valley planted their wheat and rye as usual. Then the drouth commenced. No rain fell until the end of July, and no harvests were gathered. The result was widespread suffering and starvation among 30,000,000 people. Today they are dying by the hundreds of thousands; 15,000,000 are absolutely dependent on outside aid.

Congress has voted \$20,000,000 to help save these desperate people who see death at every hand overwhelming them. At \$1 per person per month this congressional appropriation will save 3,000,000 of the starving. Who will help save the other 12,000,000?

There are only two American relief agencies working in the Russian famine area today—the American Relief Administration, Herbert Hoover, chairman, and American Friends Service Committee (Quakers). In spite of all that can be humanly done 5,000,000 of these peasants will die before summer. The problem before the American people is the saving of 5,000,000 others who have not yet been provided for but who can be saved by a prompt and generous response. The American Friends Service Committee will accept contributions for these famine victims and guarantees that every cent given for food or medicine will be spent without any deduction. All overhead is paid out of a separate fund raised by Friends.—Write the American Friends Service Committee, 20 South Twelfth St., Philadelphia, Pennsylvania.

BEANS FOR KIDDIES

To meet the emergency call for beans to replace those taken from the orphanage stores in Constantinople warehouses and shipped to the famine regions of Trans-Caucasia, contributions of beans are solicited by Near East Relief for shipment from the Pacific Coast early this spring.

Gifts of beans to date include 120 sacks from Limoneira Ranch, Santa Paula, and 100 sacks from G. M. Hartsough, Owensmouth.

Beans are acceptable whether first-grade, splits, under-sized or off-grade. Persons having beans to give are requested to deliver them to Near East Relief warehouse, 5930 South Moneta Avenue, Los Angeles.

Contributions of a wide variety of foodstuffs, clothing, farm tools, seeds, etc., to swell this emergency shipment are urged in the following appeal by E. Guy Talbott, Pacific Coast Regional Director of Near East Relief:

"More than 100,000 children are starving in the famine area of Trans-Caucasia, which is served exclusively by Near East Relief. If we are to save any considerable number of these children we must send immediately the largest possible relief cargo. The commodities most needed are staple foods, such as beans, rice, flour, dried fruits and canned goods; also clothing, shoes and blankets, seed grains and simple farm tools."

Hints to Beginners

By Henry Perkins

IHAVE before me a letter from a correspondent who wants advice as to the best way to break into the bee business. He has had no practical experience, but has seen and heard just enough about bees and beekeeping to have discovered that it has a great fascination for him. There are thousands more just like him so I am going to make my reply to his letter serve a general purpose by giving it to Cultivator readers here.

The first piece of advice I always hand out to amateur or would-be amateur beekeepers is make sure that you really want to be a beekeeper. It often happens that the fascination turns out to be transitory or perhaps entirely incompatible with realization.

A good way to settle this point is to buy a few colonies of bees, a bee smoker, veil, gloves, etc., and try your luck on a small scale. A standard book on bee culture should by all means be part of the initial equipment. Send to the nearest bee supply house for a catalogue. It will aid you in becoming familiar with beekeeping equipment, cost, etc. If there is a beekeepers club or association near you, join it. Subscribe for a bee journal. Write to Bureau of Apiculture, Washington, D. C., for bulletins on bee culture. Make the acquaintance of one or more beekeepers if possible and visit their yards from time to time just to see how they do things.

Three colonies of bees makes a nice little start. Early spring is the best time to buy them. Make sure they are free from disease. You have a right to require a certificate of health signed by the county bee inspector if your county has one.

Do not be disappointed if you fail to make a crop of honey the first season. If you fail in this respect be satisfied if you learn just why you failed. Bees will not make good honey in all locations. In some locations they will not make any, perhaps not enough to live on. All depends upon the quantity and kind of flowers available. Eucalyptus, pepper, tarweed, etc., produce honey too strong to be eatable. Orange, sage, bean, mesquite and clover honeys are among the best in the world. Alfalfa and wild buckwheat are fair examples of light amber honeys which take second place on the market. It is well to inquire into these points, beforehand. There is scarcely a neighborhood in California where beekeeping has not been tried at some time or other.

The above suggestions may be taken to apply especially to the home study method of learning beekeeping, but this is not the only way to go about it. If one is foot loose and free to devote an entire season to the study then the best way is to serve a season's apprenticeship with a practical

beekeeper. Many bee men are glad to get hold of just that kind of a helper. The want advertisement columns of a bee journal offer a good medium by which to get in touch. Bee supply houses usually know who is who in the bee world. The University of California gives short term courses in practical beekeeping which are very good. Whatever you do, do not take a plunge and rely on luck to get you by. You will almost surely lose unless you are carefully coached and advised by some one who is qualified and reliable.

SPRAY

HELP
NATURE
TO GROW
HER FINEST

There is no market for knotty fruit and wormy apples. You will find just the spraying appliance you need in our famous line of

OSPRAYMO

High Power
SPRAYERS

PREPARING SEED POTATOES

A little work in getting seed potatoes ready now will insure a bigger crop this year, as well as a better grade of potatoes and a higher price per bushel, suggests Dr. E. J. Petry at State College, South Dakota. Dr. Petry was chief inspector of certified potato seed for South Dakota during the 1921 season.

The following plan is a good one to follow if the seed potatoes have been stored in a cool, dry place and if no sprouts have developed:

Select good pure, disease free seed; i. e., throw out improperly shaped and colored tubers and those which are badly diseased.

Throw out scurfy ones with little black soil-like patches which won't wash off, but which may be scraped off with the finger nails. Scurf bigger than a pinhead cannot be killed by seed treatment.

Treat seed about two hours in a solution of corrosive sublimate (deadly poison to all animals), made by putting 4 ounces in 30 gallons of water. Don't pile tubers more than one foot high after this.

After a week or so begin to cut the tubers by cutting off the stem end to see if there is any dry rot or black leg disease inside the potato which the corrosive sublimate cannot reach. If the ring of veins near the outside is stained brown or black, cut off another slice or so until they are clear or colorless. The last cut should be made by another knife which has been standing in a bottle of the corrosive sublimate solution. Then finish cutting the potato into pieces having at least two eyes each. Potatoes from three to six ounces in weight are best for seed. Machine cutting spreads disease and is not favorable for the seed.

NEW SORGHUM HYBRIDS VALUABLE

Crosses between kafir and feterita give a promising field for the improvement of cultivated varieties of sorghum. Selected strains of this hybrid have been quite uniform in their habit of growth from the third generation to the seventh.

The most extensive series of hybridization experiments yet carried out with sorghum have been in progress for the last six years at the field stations of the United States department of agriculture in northern Texas. These experiments are being conducted by the office of forage crop investigations in cooperation with the Texas experiment station, and are being directed primarily toward the development of improved varieties of grain and forage sorghums, and, in addition, the investigation of genetic problems. Over 50 separate crosses were made between different varieties of cultivated sorghum. Many of these hybrids seem to be of no practical value, but the kafir-feterita hybrids, however, are very promising, and several selections from this group have been pronounced valuable by sorghum experts.

CORRECT LUBRICATION IMPORTANT

Correct lubrication is an insurance against rapid depreciation, repairs and loss, according to F. W. Fenn, a national lubrication authority. Incorrect lubrication may be due to the use of oils of poor quality or of wrong body. Lack of lubrication is just as undesirable as incorrect lubrication. Insufficient lubrication may be brought about by faulty design as well as inefficient lubricants. If you are in doubt as to the proper lubricant to use, a specialist should be consulted.

POTATO FIELDS PASS INSPECTION

W. V. Shear, potato specialist, California department of agriculture, reports that the following were successful in having their potato fields pass inspection for certified seed stock: W. A. Beer, W. E. Bragga, B. E. Burger, A. T. Hooven, Geo. Klussman, E. D. McSweeney, Carl Nielsen, Cleve Robinson, Geo. Van Vleck.

"A century ago it took four farming families to support one family in town. Now one farming family supports four in town in the United States. Harnessing of power with consequent increase of output per farmer is the explanation."

PETROLEUM SUPPLY FROM OIL SHALE

Extraction of petroleum from shale deposits will meet the transportation and engineering needs of the country, according to Dr. Ralph McKee, professor of chemical engineering at Columbia University. Dr. McKee says:

"It is not commonly appreciated how large these shale deposits are. If

we consider only those oil shales which will furnish a barrel or 42 gallons or better, of petroleum per ton of shale, we have in the Green River section of Colorado, Utah and Wyoming alone, sufficient to furnish 64,000,000,000 barrels of petroleum, eight times as much as the total of the well petroleum this country has produced since Col. Drake drilled the first oil well in 1859 at

Titusville, Pennsylvania, and more than five times the total production of the world since well petroleum became commercial 60 years ago.

"There also are large deposits in Nevada, California, Kentucky, Indiana, Ohio, New Brunswick and Nova Scotia and smaller deposits, though large enough for commercial exploitation, in many other portions of this continent. There are similar deposits in other parts of the world."

Exide

BATTERIES

The First Automobile Starting Battery

Not so long ago all automobiles were cranked by hand. The year 1911 saw the first car regularly furnished with electric starting and lighting equipment. *It had an Exide Battery.* Today more cars leave the factories equipped with the Exide than with any other battery.

Not so long ago farms were lighted by kerosene lamps; and farm work, like churning and pumping, was done by hand. Now, tens of thousands of farm homes have the modern comfort and economy of their own electric light and power plants—and a large majority of such plants get their current from sturdy, long-lasting Exide Batteries.

The entire history of storage batteries in all fields has been little else than a record of Exide accomplishments. Bear this in mind when it becomes necessary to replace the battery in your automobile. The experience built into the Exide, made for your car, means something to you. It means a *long-life battery* of always-dependable power.

That is more than a convenience; it is a genuine economy.

The Electric Storage Battery Co., Philadelphia

Service Stations Everywhere
Branches in Seventeen Cities

The nearest Exide Service Station has a battery the right size for your car. If your present battery needs repairs, no matter what make it is, it will be repaired skilfully and reasonably. If not in your telephone book, please write us for the address.

THE LONG-LIFE BATTERY FOR YOUR CAR

March in the Vegetable Garden

Southern California

By D. F. Reichard

WE can safely venture that very few of our readers will have an early garden this year. The cold weather and the continuing rains have greatly delayed garden operations. From now on, however, planting may go on expeditiously.

The first thing is to see that your ground is in shape for the reception of the seeds and plants that are to be put in it. Work it up to a depth of ten to 12 inches and thoroughly pulverize the ground so that there will

not be large clods with big air holes around them to dry it out. With the soil thoroughly prepared and properly enriched the success of the garden is almost assured. No matter how good the seeds, if the soil is improperly prepared the garden will be handicapped and may be a total failure. The soil is the source of nourishment for the plants, therefore it must be put in condition so that the plants can get their food. Plant food is absorbed by the plant in the form of a weak solution. An ample food supply is furnished only when the ground is worked up well before seeding, so that air is given a chance to get into it. After seeding do not disturb the ground until the young plants are up so that the rows may be easily seen,

then cultivation should begin for keeping the surface pulverized and preventing growth of weeds. If the garden is already started it is well that the surface be kept stirred up so as to keep it from packing with these rains. Thin out everything so that the remaining plants may make their proper growth, for we will soon be having good warm growing weather.

During March almost everything can be planted, the more hardy things like beets, carrots, turnips, radishes, parsnips, lettuce, onions, salsify, spinach, peas and potatoes; later in the month the more tender summer growing stuff like beans, sweet corn, muskmelons, cucumbers, summer squash and roselle. Set out pepper, tomato, eggplant and sweet potato plants.

Watch out for aphids; with the first warm days they begin making their appearance. Spray with black leaf 40 or dust with a powder containing nicotine.

Northern California

By A. R. Gould

THE wonderful rainfall to date has encouraged all gardeners and the prospects for a profitable season are bright. Everyone should get busy now and prepare for the planting season, which will soon be well advanced. Digging and manuring will be the chief items in preparation. The manure must be trenched well under so that all the deep rooting crops will have their supply of food close at hand, and while it is not advisable to be too liberal with manure, apply enough to cover the surface and then trench it in. On heavy soils apply a light covering of lime and rake it in. Do not trench this under as you would manure.

It will not be too early to prepare all the plots for corn, dwarf beans, cucumbers, melons, tomatoes and squash. The wise grower usually starts early in the year with a plan and on this the positions of the various crops are marked, then the date of sowing, the quantity, source of purchase, seedsman, observations on germination and yield of crop, with date of harvesting. This data in a record book is invaluable and is essential to all who would practice the rotational system and be able to balance their garden accounts. Where turnips occupied the plot last year plant peas and after peas plant beets or carrots or some such root crop. Peas leave the soil in good condition as they bring a quantity of nitrogen into the soil so that a gross feeding crop such as beets or carrots would benefit. Another reason in favor of the rotational system is that certain insect and fungous pests attack a particular crop and if these crops are changed over the pests starve.

Potatoes

See that the soil is well manured. A fairly sandy loam is ideal. It should be deeply plowed and only clean tubers planted. The tubers should be dipped in a solution of formaldehyde. Plant in rows four to six inches deep and 12 inches apart, rows 20 inches apart. The best method is to start the tubers in shallow boxes near a window, and in two or three weeks they will be ready to plant out. The large tubers can be cut up into two or three sections, but always leave at least two or three eyes to a section. Early varieties to plant now are Early Rose Improved or Red Prizetaker and British Queen, and the main crop varieties to plant later on are White Burbank, White Rose and American Wonder. Five to six sacks of tubers will be required to plant an acre.

Peas

All the early varieties should now be coming into flower and must be cultivated between the lines. Sowings of Little Marvel, Alderman, Abundance and Yorkshire Hero may be made this month for succession. They should be sown very thinly in rows three feet apart.

Turnips

Sow White Egg and Early Snowball very thinly in rows 20 inches apart. Purple Top Flat Dutch is also a very good variety for table. Those sown last month will need thinning out.

Beets

If the varieties were sown as advised last month and are an inch above the ground they should be thinned to at least four inches apart.

Carrots

In well prepared rich soil sow the French Forcing Long Orange and Oxheart. The last named is very desirable for heavy soils. Sow the seed in drills very thinly, half an inch deep and 18 inches apart.

Onions

It is important to thin out this crop now to a distance in the rows of four inches, and many of the young seedlings may be transplanted to other plots. Keep the cultivator busy between the rows.

Lettuce

Sowings of Los Angeles variety and May King may be made this month, and those early sown should be thinned to six inches apart. It delights in a fairly rich soil.

Usefulness

Is lack of power preventing you from farming more land?

Are your crop yields limited by shallow plowing, or by seed beds prepared improperly or too late?

Will the spring work leave you tired out and dissatisfied this year because of the slow progress you made?

You can overcome all these limitations, and the losses they cause, by the purchase of a Case Tractor *now*. You can realize a profitable return on its dependable power and ability to do all your heavy work.

Case Tractor Sizes; 10-18, 15-27, 22-40.

One of these sizes will meet the power requirements of your farm. The 10-18 will plow from 6 to 9 acres a day and perform other work at a corresponding rate. The 15-27 will perform the same operations about fifty per cent faster. If your field or belt work demand greater power, the 22-40 will best meet your requirements.

Because of its greater efficiency, the largest tractor you can use advantageously will prove the most profitable.

Power.

Case heavy duty kerosene engines are noted for their power, flexibility and economy. Case Tractors have demonstrated remarkable economy and efficiency by winning the majority of all important tests in which they have been entered.

Ample reserve power has been provided to meet all emergencies with recommended loads. An even flow of power from flexible, Case four cylinder, valve in head engines is always ready for light or heavy pulls. The sure acting governor automatically maintains correct field or belt speeds. With the two speed transmission

it is possible to get maximum results from the various implements used. A well designed drawbar of proper height and with a wide range of adjustment makes the correct hitching of plows and other tools easy.

Belt Work.

Belt operations are often the most profitable work of a tractor, and, on the average, make up more than a quarter of its entire work. On Case Tractors the belt pulley is mounted on the engine crankshaft where the full power of the engine is available for belt work. Being directly in front of the operator it is easy to line up with the driven machine. This feature saves hours of time in a busy season.

General Purpose Tractors.

All three sizes of Case Tractors are adapted to road hauling, grading, and all field operations by reason of correct weight, proper weight distribution, and effective traction speeds.

The requirements of actual farm work determined the essentials of Case Tractor design and construction. That is why the Case is so well adapted to all kinds of drawbar and belt work—so useful to farmers.

Call on the nearest Case dealer for complete information about Case Kerosene Tractors, Threshers, Silo Fillers, Baling Presses, Road Machines, Grand Detour Plows and Disk Harrows, or address a postcard to

J. I. CASE THRESHING MACHINE COMPANY

Tomatoes

Hot beds should now be prepared to sow seeds of the early varieties, Early Jewel and Bonny Best. If only a few plants are required sow in a box and place in a window and prepare this plot for planting up later on.

Artichokes

Still time to plant these; strong plants should be secured and planted in well manured soil at once.

Raspberries

Those who planted last month should cultivate this plot to keep the weeds down. The work on the old plots will consist of cutting back the canes to within three feet of the ground. Large roots may be still divided and the subdivisions used for replanting. It is very essential that this work be completed this month.

WIPE OUT EVERY RAT AND GOPHER

Amazing New Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers—in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery, is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your poultry, especially baby chicks, and egg hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency M. O., Check, etc.) and we will ship you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept 744, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days, or your \$1.00 will be cheerfully refunded.

Strawberries

Planting of these should also be completed this month and strong well rooted plants put out in rows 12 inches apart and the rows two feet apart, as this will give room for using the small wheel cultivator, which is a very useful implement to use on the strawberry plot. Secure such varieties as Banner, Brandywine, Ever-bearing and Gold Dollar.

Loganberries

This is really a very profitable crop as the berries are in great demand, and on a fairly rich soil, not too heavy, will thrive. They may be planted in much the same manner as blackberries and trained on a fence, or if you have a wall in the fruit garden you need to cover you may run the loganberries on wire on the wall. Plant only well rooted tip plants one year old if you want the best results.

A DEPARTURE IN LAND SELLING PLANS

A radical departure in established methods of "securing a home in California" is announced by the Kirkman Nurseries of Fresno. The lands may be contracted for to be planted to first class trees and vines and cared for until the trees are of bearing age and the place has become profitable. Thus far there is no "departure," for this has been a favorite plan with many promoters. But here is where the departure comes: "We will furnish the land and bring it into bearing under the guarantee that it will be profitable or all money invested will be returned with interest. Payment made by customers constitutes a first lien. If property becomes highly profitable customers will take deed. If only fairly remunerative the customer has not taken a greater hazard than to make a safe real estate loan." Another feature wherein this proposition is somewhat different from former propositions is that the Kirkman people are lifelong Californians and are thoroughly known by their dealings of many years.

PLANT QUARANTINE HEARING

The conference on plant quarantine called to meet in Washington March 15 has been postponed until April 19. The first date, it was found, conflicted with important national and international flower shows scheduled for the latter part of March, thus preventing many florists and horticulturists from attending.

The conference will meet at the offices of the board, April 19, for the purpose of considering the advisability of any modifications—additions to or deductions from—of the classes of plants permitted entry under permit for immediate sale under Regulation 3 of Quarantine 37.

CALIFORNIA'S FIRE BILL

A million dollar loss to timber range and grain was California's tribute to the fire demon during the past season, according to the annual fire report issued by the United States forest service and the California state board of forestry.

The report states that 2,245 fires were handled by the federal government and state. Information secured by these bureaus shows that in addition 293 grain fires burned within the state. The alarming and disconcerting fact that 90 per cent of these fires result through carelessness and negligence of man, the officials of these bureaus state, deserves the serious attention of all Californians, particularly when the statistics indicate that 745 of these fires are directly chargeable to campers and smokers. As travel along the highways and in our mountains increases the public must exercise greater care with fire if our resources are not to suffer irreparable loss.

The report shows that the losses were made up of the following: Timber \$67,851, range \$367,243, improvements \$189,738, and hay and grain \$370,506. The fire bill is further augmented by an item of \$175,000 spent for fighting these fires. Six hundred state and federal officers are engaged in the difficult task of controlling the fires in California's forests and on the watersheds.

OILPULL TRACTOR

The 4 VITAL FACTORS of Cheapest Tractor Power

4

REASONABLE PRICE

2

LOWEST UPKEEP EXPENSE

3

LONGEST AVERAGE LIFE

1

LOWEST FUEL COST

A Baffling Problem Solved in the OilPull

For many years engineers have known the Four Vital Factors necessary in a tractor to make cheap power. These are (1) Lowest Fuel Cost. (2) Lowest Upkeep Cost. (3) Longest Life. (4) Reasonable Purchase Price. (See diagram above.) The problem has been to combine these four vital factors in one tractor. The Rumely OilPull produces *cheapest farm power* because it *combines all four*.

Triple Heat Control

There are several unusual features in OilPull design and manufacture. Chief among them is *Triple Heat Control*...the perfected, scientific, oil-burning system which solves the problem of getting the power out of cheap kerosene. Due to *Triple Heat Control*, the OilPull is sold with a bona fide, written guarantee to burn kerosene successfully under all conditions and at all loads up to its full rated brake horse power.

Write for Free Booklet

The local Advance-Rumely Dealer will gladly demonstrate all the features of the OilPull. In the meantime, write for a copy of our catalog and the new Triple Heat Control booklet.

ADVANCE-RUMELY

California's Oldest Orchard Disc Plow

THE KNAPP Power Lift Orchard Tractor Disc Plow

There's a reason for the state-wide popularity of the Knapp Orchard Disc Plow. In the first place its manufacturers are pioneers in the Orchard Disc Plow business. It is a California product built expressly to meet California requirements—hundreds of Knapp Plows are in successful operation.

There are many special Knapp features of construction which with the 1921 improvements make it the unchallenged leader in Orchard and Vineyard as well as field work. It is built low, has narrow frame, light draught, and has no levers of any kind to injure low hanging branches of trees.

The Knapp frame permits plowing close to trees either to or away, and is adjustable to hard or soft soil. It is particularly adaptable for plowing under high cover crops.

The KNAPP HITCH, which enables the operator to plow to or from the trees by making but one adjustment, is a revelation in tractor hitch construction. The Hitch has an automatic wheel lock which permits backing the plow.

The KNAPP POWER LIFT is gearless and has less working parts than any other power lift made—only one part is in continuous motion and this part is dust proof.

KNAPP PLOWS come in two, three and four disc sizes. They are built of finest grade materials obtainable. Thus the purchaser of a KNAPP ORCHARD DISC PLOW is insured perfect plow satisfaction.

EVOLUTION

At twenty-one, all unannoyed
By any form of care,
The only verses we enjoyed
Were those that spoke despair.
We loved the way that Mr. Gray
Expressed his brooding gloom,
And all that Hamlet had to say
About impending doom.
On Burton's works we sadly mused,
And heavily we fell
For every phrase that Byron used
To bid his "Janes" farewell.

But when distresses of our own
In later years we had,
We liked a literary tone
Less lachrymose and sad.
A bit of joy in life we took
And every little while
We really liked to read a book
Designed to make us smile.
No longer did we shrink from fun,
No harm in mirth we saw,
We fed our souls on Chesterton,
And sat up nights with Shaw.

And now, when Fate has handed us
A few good smashing soaks,
We find we do not care a cuss
For anything but jokes.
A bit of nonsense now and then,
To heal life's blows and belts,
Is relished by the best of men
But we like nothing else.
And even this is going to cloy:
We know, a few years hence,
The only things that we'll enjoy
Are comic supplements.—James J.
Montague.

STARLIGHT

By Marion Hamilton Carter in
Youth's Companion

TARLIGHT is a sleek, red, part Jersey calf with a white irregular spot on her forehead. That accounts for the "star" in her name; the "light" was Polly's poetic addition. When Starlight arrived at the ranch she was only two days old, very fuzzy, very wobbly and very, very hungry. She was a present to Polly from a neighboring rancher; and Polly, whose heart is tender toward everything that is young and hungry, threw her arms round her neck and kissed her smack on her cold, wet nose. She saw no impropriety in kissing a calf on the nose; nor did the calf, for she returned the salutation with a huge lick of her tongue, another, another—

Polly's mother and I were at a little distance, talking to the rancher who had brought us Starlight, and we had not noticed Polly until we heard her scream, "Ma-a—ma-a! She's eating me up!" and our horrified eyes beheld Polly flat on her back and Starlight, straddling above her, apparently chewing the child's head off.

All three of us plunged for the calf at once. My sister rescued Polly; the ranchman lifted the calf bodily in his arms; and I said, "Shoo!" in a fierce tone and flapped my arms. Starlight hung over the ranchman's shoulder, licked her lips and gazed round in an astonished, regretful way. The minute he set her down she threw up her tail and frisked in a bee line for Polly.

There was nothing bloodthirsty in Starlight's intentions; she was merely showing her affection in an untamed manner; and when my sister slapped her soundly and ordered her to get away Starlight straddled out on her newborn legs and said, "Moo-oh-moo-oh-moo!" in so mournful a voice that Polly was ready to offer her cheek again.

"I believe," she said bravely, though she still trembled in her mother's arms, "the calf didn't really go to eat me; she was only trying to kiss me back and didn't know how."

Starlight moored.
"See!" she understood and said yes," cried Polly. "It wasn't an eat, it was a kiss she did me."

"Well, I'll teach her not to do it to you again," my sister said sternly. "Kissing calves aren't allowed on this ranch."

Starlight moored.
"O mamma! She understood what you said!" Polly exclaimed. Then, holding out her little hand,—the other clung to her mother's neck,—she said,

"Starlight, I love you, and I'll love you always."

Starlight swayed on her wobbly legs and looked from Polly to my sister. You could see that her poor little two-day-old intellect was torn with conflicting ideas. Should she run to Polly and be hers forever, or should she run away from Polly's mamma? Our ranchman settled the question for her by leading her up to the corrals.

Unlike most of Polly's pets, Starlight was a creature of intrinsic worth; she was stock, and stock means money. So the entire family, including Jim, the hired man, had a personal interest in rearing her properly.

Now, my sister had accepted Starlight, believing that one of our cows would adopt her. A cow will often adopt a calf, especially if her own calf has been taken away. But when Starlight arrived our cows were out at pasture, and we were obliged to feed her by hand. It seemed easy; we merely filled a lamb's nursing bottle and gave it to her. But Starlight was unfamiliar with the method; she swallowed the milk, bottle and all!

We rescued the calf from death by strangulation; I held up her head while my sister retrieved the bottle.

Polly, with an eye solely to her pet's gratification, hung over the gate and piped at us, "Why don't you let her swallow the bottle if she wants to? I can find her dozens more."

To the tune of that advice we saved Starlight's life six times. Then we poured the milk into a wooden tub. But the calf had never seen milk by the quart, and she regarded it indifferently and moored. There was anguish in her tone.

"Poor Starlight!" Polly said miserably from her throne on the gate. "Poor, dear, hungry, starving little baby cow!" There was anguish in Polly's tone also.

I held the tub, and my sister pushed Starlight's nose into the milk. She gave a snort, and milk rained on my shirt waist and soaked me to the skin. Starlight licked her nose with relish and bewilderment. Where had that milk come from? And where, oh, where had it gone? She moored mournfully.

"Say," shrieked Polly, "fill the bottle and pour it down her throat."

Not knowing how else to get the calf to eat, we did as she bade us. My sister held up Starlight's head and pulled her jaws open. I poured. The milk appeared to be going down the right way, for Starlight said, "Gop-pity-woppity," which I took for "All right, go ahead," and I delivered two quarts.

Starlight caught her breath and coughed. Milk rained; it poured; it seemed to me there was a cloudburst of it right in my face.

"Moo-oh-moo—oh—moo-o-o-o!" lamented Starlight.

"Poor, dear Starlight; poor, hungry, little Starlight!" lamented Polly in sympathy.

"How about your poor dear aunt?" I snapped, mopping my face with a handkerchief. My sister was trying to smother her mirth on Starlight's neck. "I'd like to borrow your handkerchief," I remarked coldly, wringing my own out for the third time.

My sister looked up and laughed. "Forgive me, dear," she said. "But if you could only see how funny you look—" and she burst out laughing again.

Starlight gazed at me reproachfully and moored. "Poor Starlight, dear Starlight!" cooed Polly. She saw nothing funny either.

"Now," said my sister, "you'd better hold her jaws open and let me pour. I think I see the way to do it."

So I took Starlight's head under my arm and pried her jaws open.

"You ought to have started like this," observed my sister, "farther out on her tongue, so that her tongue would guide the flow," and she delivered two quarts.

Starlight said, "Gop, gop, gop, gop-pity-woppity," just as she had done before, caught her breath and coughed. A flood of milk was hurled into my sister's face.

While she was mopping herself with her apron, Polly called, "It's my turn

Feed Them Well

—one way to *keep* boys on the farm

OF course your boy knows that "no one cooks like mother." But you can do more for him than merely *cook* deliciously. Your *choice* of foods will please him and be more important to his vital energy and strength.

Give Him Raisin Pie

Make your rare pie crust and fill with luscious *raisins*! There is *flavor* for him! The juice forms a luscious sauce.

Bread Pudding

Bread pudding made with raisins is not only delicious but is economical, since it solves the problem of left-over bread.

Raisin Pie

2 cups Sun-Maid Raisins, 1½ cups boiling water, ½ cup sugar, 2 tablespoonfuls cornstarch, 2 tablespoonfuls lemon juice, 1 tablespoonful grated lemon rind, juice of 1 orange, 1 tablespoonful grated orange rind, 1 cup chopped walnuts.

Cook raisins in boiling water for 5 minutes, pour into it sugar and cornstarch which have been mixed. Cook until thick, remove from fire and add other ingredients. Bake between two crusts. Walnuts may be omitted if desired.

All measurements for this recipe are level.

Blue Package (seeded) best for pie and bread.

But there, too, is wonderful nutrition to rebuild his energy and maintain his vim.

Raisins furnish 1560 calories (a unit of food-value measurement) of energizing nutriment per pound. Eggs, milk, potatoes and most meats fall short of raisins in this energizing value.

The energy comes from the pure fruit-sugar of the raisin, which is in practically predigested form. Thus raisin pie revives men after a hard day's work almost immediately.

There is food-iron also in the raisin—good for the blood.

This pie, therefore, is both so good and good for men that you should make it for them frequently.

SUN-MAID RAISINS

Be sure to get the Sun-Maid brand of raisins produced from California table grapes—the finest grown. Tender, meaty, juicy, rich in sugar. All stores sell them. Get a package now.

Raisins are 30 per cent cheaper than formerly—see that you get plenty in your foods.

Seeded, blue package (seeds removed), best for pie and bread; Seedless, red package (grown without seeds), best for stewing; Clusters (on the stem). A delicious quick dessert.

Your grocer has them. Ask for the Sun-Maid brand.

Mail coupon for free book of more than 100 tested recipes for delicious raisin foods.

now. I'll show you how to get Starlight outside her dinner." And she slid over the gate and joined us.

"You didn't go at it right," she said. "You can't pull her outside her dinner; she's got to suck herself outside it, and you've got to give her something she can suck."

Polly dipped her fingers into the milk and held them out. Starlight sucked. Then Polly sank her fingers below the milk in the wooden tub. Starlight kept on sucking Polly's fingers, and the milk began to disappear. I noticed that Polly's lips were tight, and that she did not triumph over us as might have been expected.

"Doesn't it hurt?" I asked.

"N-no," she replied bravely, but winking hard. "That is, it doesn't hurt more than I can stand for Starlight's sake."

(To be continued next week)

HOUSEHOLD QUERIES

Italian Salami

(This recipe, we are sure, is the one desired by our Lompoc subscriber. Trust our Cultivator housewives to furnish anything that's wanted! We appreciate most heartily the kindness of our readers who have searched their recipe books and inquired among friends to find this and other recipes requested. All, by the way, are worthy of filing in a "Cultivator Cook Book.")

To 100 pounds beef and pork (we use more beef than pork) take 2 pounds salt, ½ pound black pepper, ½ pound cinnamon, 4 cloves garlic or garlic to suit, 2 tablespoons allspice, 2 tablespoons cloves, 2 tablespoons nutmeg, 1 ounce red pepper, 1 ounce saltpeter, ½ gallon each claret wine and broth. One may use either claret wine or the broth from the bones of the meat simmered until it will thicken after the bones are removed from it and it is left to cool. If both are put in use ½ gallon each. If the broth is used alone take 1 gallon of it. This is fine.—Mrs. W. H. Hackett, Ferndale.

Salami Hints

In making the sausages the coarsely chopped meat is first minced with sugar, salt and a little saltpeter and allowed to cure for a few days. Then comes a second finer mincing, next the addition of spices or herbs or both, and finally filling into casings and smoking. The seasoning is a matter of taste.

Salami (Italian)—Equal parts finely minced lean beef, lean pork and fat pork, moistened with red wine, flavored with garlic, shallots, cloves, cinnamon, etc.; stuffed into beef casings previously soaked in vinegar and made into a chain of small, nearly round sausages. The sausages are later put in brine for several hours, then hung for about two weeks and finally washed and dipped in lukewarm mutton tallow, the last named process to prevent drying out. Hung in proper temperature they will keep for years.

Salami de Verona is similar to above but generally contains a larger proportion of beef, and brandy is used instead of wine.

Salami Hungarian—Four-fifths moderately lean pork and one-fifth fat bacon coarsely chopped, flavored with paprika, etc.; stuffed into narrow beef casings, steeped in brine ten days to two weeks, dried and smoked.

Am sending the above not for a year's subscription, but hoping the Lompoc subscriber will find some help from them, and in return, I am asking her for a few names for trails among "The Redwoods" in the mountains.—Mrs. A. Stainton, San Francisco.

("Names for trails among the Redwoods" sounds interesting, "intrigues our fancy," in fact, we are plain curious. Won't Mrs. Stainton tell us something about why and where and what for? There are several of us who would like to help name Redwood trails).

The Real Thing From Italian Chef

Am sending a salami recipe which was given me by a chef who at the time cooked at the Flor de Italia in San Francisco. Hope that it will be what Lompoc subscriber desires:

25 pounds lean pork, 10 pounds lean beef, 1 tablespoon each cinnamon, cloves, allspice and nutmeg, 1 teaspoon mace, 1 pound garlic well crushed, and 1 pound salt. Chop meat

well and rub spices and salt well into meat; add garlic and put in a pan. Cover with equal amount water and claret wine. Let stand three days, then drain out liquor well and stuff. Let stand one day to dry and then finish drying with a very light smoke.—Mrs. F. Ribeine, Arcata.

That Wanted Salami Recipe

20 pounds choice lean beef, 50 pounds choice lean pork meat, 30 pounds hog fat (back preferred), 2½ pounds salt, 4 to 6 ounces alspice, 6 to 8 ounces ground white pepper, 4 ounces whole black pepper, 3 ounces saltpeter, 2 ounces garlic, mashed very fine, about half quart white or red wine.

Grind beef, then grind again with pork meat and hog fat. Add all ingredients and mix well or until it sticks together. If not worked well it is liable to spoil.

(Important: After meat is cut and ready for grinding put in sack and hang up for about 12 hours to drain free of blood—not the fat.)—V. C. Capagno, Patterson.

THE NEW THINGS IN CLOTHES

Clothes are more than ever fascinating this spring, both as to materials and styles. The good old standby materials, the serges, tricotines and crepes; the good old standby styles, the chemise dress and the Russian blouse, are very much to the fore.

Skirts are longer—in spots. Eight inches from the ground is the present accepted length, with side panels, draperies or sashes falling almost to the ankle on one side, on both sides or, as we said above, in spots, as suits the wearer's fancy—may her guardian angel see to it that her fancy is guided by an artistic eye!

Splashy bands of embroidery, splashy spots of embroidery, or splashy embroidery solidly covering an entire blouse—skirt perfectly plain—or gown severely plain with solidly embroidered sleeves joined to a drop shoulder. These are some of the interesting fea-

tures of the new clothes. Brocaded materials, Paisley figured silks, are used in the same way as the embroideries—a bit of rich contrasty color giving character and individuality to a foundation gown of simple lines.

Bouffant skirts, even hoops and ruffles, appear for those who wear them well. But these, generally, are confined to the fluffy evening things. The waists remain long—to the hips and rather more snugly fitting, some almost like the old fashioned basques.

The shoulder to shoulder neck line, back and front, prevails, varied by high, straight collars of embroidery on some of the Russian blouse effects and the ever becoming middy neck on many of the sports and street dresses.

Exquisite loose, spongy weaves are shown for sports things. These are in cotton, in wool and in silk. Blouses and skirts, dresses and capes, jumpers and coats make stunning costumes when developed in the same material; but as often as not they are of contrasting color and material.

The cape has been steadily growing in popularity. A three-quarter tailored cape with jumper dress to match, edges bound with military braid, makes a serviceable and exceedingly up-to-date combination. Shorter capes with sport skirts, longer ones with dressy gowns are seen everywhere.

An interesting feature is the use of squares or oblongs of material, joined with sloping shoulder, made into blouse, cape or coat.

AUSTRALIA TO REGULATE PICTURES

New South Wales is preparing regulation of picture shows, that is, attendance by children. Examination of 14 Melbourne schools showed that 45 per cent of the children attended film exhibitions more than once a week, 11 per cent attended twice a week and the remainder went once or oftener a week. The committee expressed the opinion that no child under 15 years of age should be allowed to attend after 6:30 p. m. on any school day.

JELL-O for children! Children know what pleases them and they enjoy pretty desserts that taste good just as much as the grown-ups do.

It is a real boon to a busy mother to find a dessert that her children like and ask for and which she knows is good for them. That is why Jell-O is such a great family dish,—they all like it.

You are Wasting 35% on Fuel!

If you are still using coal or wood in your cook stove, heater or furnace, you are daily losing money, to say nothing of the waste of time and labor in carrying in fuel and emptying ashes.

Double Burner as shown complete with tank and all fittings.....(\$18 for cook stoves)
Single Burner complete.....(\$12 for heaters)

With the New Superior Coal Oil Burner

you RETAIN 90 per cent of the heat in the stove instead of LOSING half of the heat up the chimney as with coal or wood. KEROSENE IS THE CHEAPEST AND CLEANEST FUEL KNOWN when made into a pure hydro-carbon gas with The New Superior Oil Burner. The Superior generates its own gas from common kerosene, burns with an intensely hot, clean flame, is smokeless, roarless and so constructed that women can easily operate it. Heat can be concentrated in any part of the stove desired by means of our patented divertible flame spreader.

Gravity feed eliminates the bother of pumping up tanks and the burner is guaranteed for life not to fill with carbon. Can be operated with a closed damper, thus retaining 90 per cent of the heat generated. Anyone can install The New Superior in a few minutes time. Fits any stove.

Resolve today to have the convenience of gas combined with the heating qualities of coal at half the cost of either and at the same time eliminate sooty curtains and woodwork.

Health Insurance for Milch Cows

— a penny a day keeps a cow fit

WHY take chances with cow health, when such a little outlay will keep the whole herd in the pink of condition and producing at maximum profit? Now-a-days Kow-Kare is being used fully as much as an aid to perfect health and milk yield during the winter as it always has been as a medicine for cow diseases.

Actual tests in hundreds of dairies prove that Kow-Kare can be used as a preventive and production aid with wonderful results, at a cost of only about a cent a day per cow. Easy to prove it for yourself; select a poor milker and use Kow-Kare according to directions for a short period. By improving the assimilation and digestion, you will note a decided gain in milk yield.

Kow-Kare has positive medicinal qualities that build up and strengthen the organs of production and reproduction. As a sure, reliable remedy for Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc., Kow-Kare has a reputation of twenty-five years success.

Dairies that use Kow-Kare as "health insurance" are the profit makers. Our free book, "The Home Cow Doctor," has many valuable hints for cow owners, besides definite information on how to treat cow diseases. Send for your copy today.

Kow-Kare is sold by general stores, feed dealers and druggists at the new reduced prices—65c and \$1.25

Wanted---An Agrarian Moses

By A. L. Spellmeyer

WHEN the world was young the time arrived when human destiny demanded the service of a prophet and law giver, a man inspired, by name Mr. Moses, who gave to a chosen people the laws of social and commercial life and led them to a Promised Land distant from the worship of Baal, the golden calf.

Now that the world is old, conditions of life and procedure have evolved a complicated system governing the life and habits of man, that have brought about the control of food and its price to the producer by middle marketers.

Completely efficient, in the most robust and civilized of nations, our own country, this middle marketing system has become arbitrary in the profit it demands and equally unwilling to permit to agricultural effort a fair price.

An agrarian Moses is the present need of agriculture, a super-man who will group the producers to a common banner, and with wisdom and constraint persuade a cooperative strength that will force into effect forgotten ideals of fair dealing and economic justice. Who that man will be we do not know. There are many sporadic leaders of the agriculture host, but they lead divisions and do not command the army.

Christian nations have made laws and followed usage to some extent to insure peace and plenty, and Christian theology distinctly defines legitimate profits and fair dealing as honesty, and profits based upon the power to demand as dishonesty and theft.

Though 30 per cent of the nation's people are engaged in agriculture they are at present in a purgatory of less than cost operation, while contributing heavily to a national, state and city spree of taxation and extravagance.

Commerce riding in the vehicle that production hauls, notes the steed is lame and thin and is worried by the slow progress, but neither stops to feed the hay of cost of production nor the oats of just profit, and will not walk awhile to lighten the load.

Commercial honesty is today a rare quality. Adulteration is frankly general, shorting a custom in either quality or quantity, and it may apply to a butcher with his thumb on the scale, a commission killer who trims the carcass, a packer who buys under the market on livestock or fruit, a feeder who short weights a guaranteed ration, a clothier selling shoddy for wool, a shoe merchant selling paper for leather, or a broker selling you fake oil stock. Business is based upon the power to deflate in purchasing and inflate in selling, upon creating new demands and appetites, and is not concerned with lowering the handling expense of staples nor bettering quality. In many commodities the profit margin and middle marketing cost exceed the price paid the first producer of that commodity. The effort is not to lower the commodity cost to the consumer but to keep that profit at its maximum possible to obtain and compete for volume.

If all this did not hit at the main dependence of the nation, its agricultural and livestock industry, and if it did not indirectly affect generally prosperity and good times, the condition would not be alarming, but the loss of the farmer, and his lack of buying power have slowed up the wheels of all industry.

The farmer can well agree with Hamlet, of Bill Shakespeare era, "The times are out of joint." A similar phrase was found carved in symbols upon an ancient Egyptian tomb. The country has been "going to perdition" a long time but it has not yet reached that destination. We need a Moses, as we need a new set of commercial usage and laws arranged to the modern need. We don't all need to work at manual tasks of farming, manufacturing or retailing, as only savage nations work in the entirety of population, and the more advanced and prosperous a country the greater its

production becomes with less people employed. Our ill, the very ill that menace our agricultural health today, are ill that have come to us from progress with modern methods of production. The Moses that must lead the agrarians must enforce justice for the 30 per cent but not enslave the 70 per cent in other pursuits.

Today the farmer is apathetic. He is with many worries not always amiable, with years of experience he is conservative and slow to adopt new methods, but with hardship and loss he is glutton, though in many instances helpless through debt and responsibility. Job had no more troubles than the farmer of today.

Our agrarian Moses may be Wallace, the secretary of agriculture, who is building up the farm bureau and cooperative farmer associations. He will not be Kenyon, who retires to the bench, but it may be Hoover or Capper or Kendall. Harding himself shows signs of a canny economic wisdom that seems to soften disputes, that might qualify him as time goes on to formulate a better economic distribution of what the consumer pays out. Barret, the farm leader, seems too self centered, and Henry Ford too scattered. The Sir Galahad of the cowman, our local production, Fred Bixby, just chosen by the National Livestock Association as a leader, has a chance to qualify. One thing is certain, the agrarian Moses has a task to harmonize ten million farmers.

CARBOLA
The Disinfecting White Paint

A WHITE paint and disinfectant combined in powder form that is ready to use as soon as mixed with water, and is applied with brush or spray pump. Will not clog the sprayer, has no disagreeable odor and doesn't flake, blister or peel off. It can be applied to wood, brick, stone, cement or over whitewash.

ANOTHER WORLD RECORD FOR CALIFORNIA

The remarkable records established the past few months by daughters of King Segis Alcartra Prilly in the Bridgford Holstein herd at Patterson have been the sensations of the year. But a short time ago we recorded the fact that Bessie Veeman Alcartra Prilly had established a new senior two year old record of 1062 pounds of butter from 27,255 pounds of milk. Now comes her half sister, Louise Alcartra Prilly, with a new junior three year old seven day record of 40.19 pounds of butter from 590 pounds of milk—the first 40 pound record to be registered in that class. The new champion, as a two year old, had a seven day record of 23.86 pounds of butter from 546.7 pounds of milk and a 365 day production of 865 pounds of butter from 23,250 pounds of milk.

Louise Alcartra Prilly, as noted, was sired by King Segis Alcartra Prilly and her dam was Louise of Riverside. After giving full credit to her sire, that by his show ring record and the splendid records of his daughters must be rated as one of the great bulls of the breed, it is interesting to note that through her dam she reaches bloodlines that have played important parts in the development of the breed in this state. Louise of Riverside, with a 365 day production of 814.22 pounds of butter from 18,362.3 pounds of milk, is a daughter of the great old cow Minnewawa Louise, with seven tested daughters, and through her sire, Beryl Wayne Korndyke of Riverside, is a half sister to the 1003 pound Pet Salambo of Riverside. The grand dam of the new champion, Minnewawa Louise, is likewise a half sister to the celebrated foundation cow Aralia, dam of Aralia De Kol and the ancestress of some of the most famous producers in the Morris herd.

WHY QUARANTINES ARE ESTABLISHED

Quarantine regulations should not be resented by livestock owners. There is no disgrace connected with having an infectious disease attack the livestock, however unfortunate it may be, and quarantine is adopted only when essential to the control or prevention of the spread of such an infection. These regulations are never adopted unless necessity requires it, for there is usually associated with it some unavoidable inconvenience, and it is the general policy of the department of agriculture to work no hardships upon any of the interests under its supervision beyond that which the circumstances demand. In case a quarantine is necessary the convenience and interests of the stockmen are always considered before the provisions of the quarantine are established, and in every case such provisions are reasonable and just as lenient as is compatible with successful disease control work.

MILKING MACHINES IMPROVE QUALITY OF MILK

Certified milk is being produced with milking machines, and also market milk of a good grade, under ordinary farm conditions. There is no short cut, however, to cleanliness, and neglected machines will not draw clean milk. To attain this objective machines must be thoroughly washed and sterilized. The milking machine is sure to play a larger and larger part in the economics of dairying. For this reason it is important that care be taken in sanitation, so that nothing will impede its development.

HOW MUCH TO FEED THE COW

Under most circumstances the cow should be fed all the roughage that she will eat up clean, adjusting the grain ration to the milk production. Only when the cow tends to become overfat should the quantity of roughage be restricted.

A grain mixture should be fed in the proportion of 1 pound to each 3 pints or pounds of milk produced daily by the cow, except in the case of a cow producing a flow of 40 pounds or more, when the ration can be 1 pound to each 3½ or 4 pounds of milk. An even better rule is 1 pound of grain each day for every pound of butter fat produced during the week by the cow.

Feed all the cow will respond to in milk production. When she begins to put on flesh cut down the grain."

You too can Make Grade A, Certified Milk

FROM New York to California, dairymen who use Empire Milking Machines are making records for milk with low bacteria count.

The letter shown above is just sample evidence of how the Empire Milking Machine is helping dairymen to produce certified and grade A milk with a great reduction in labor costs.

Arden Farms Dairy Co., Arden, New York, reports 5225 bacteria per cubic centimeter—4775 better than the requirement for certified milk. Elliott Brant Rancho, Los Angeles, Cal., reports 1300 per c. c. R. L. Kirby & Son, Dallas, Texas, reports 9000. (The city standard of Dallas is 50,000 per c. c.)

The Empire Milking Machine of 1922 with its pulsator guaranteed even against wear for four years service is an investment which pays for itself long before the guarantee is up. The Empire is now selling at the lowest price since it was invented.

Go to your dealer and see this machine or invite him to call upon you. Have him show you how the Empire will enable you to produce better milk and more milk at lower cost. Write today for complete facts and the evidence that Empire users have to offer. Ask for catalog 52-M

EASY TERMS

Sold on such easy terms that it will pay for itself while you are using it. See your De Laval agent now or write us about getting a new one.

No matter what your system of farming may be or where you live, you need a De Laval Separator and some cows.

Cows furnish the best market for your feeds, and they keep the fertility of the soil on your farm.

Then the De Laval separates the cream, which brings you in a steady cash income, and leaves the skim-milk in the best condition for feeding calves, pigs and chickens.

This is the surest, safest and most profitable system of farming—and the De Laval Separator has made it possible. It is the original separator, skims cleaner, lasts longer, turns easier than any other. There are over 2,500,000 De Laval Separators in use the world over—about as many as all the rest put together. The De Laval has always led in every important separator improvement and is recognized everywhere as the world's standard.

You may be wasting enough cream to pay for a De Laval by using a worn-out separator or by hand skimming.

CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

DISPERSAL SALE

37 REGISTERED HOLSTEINS

L. W. Bardsley Herd
Tulare, Calif.

Tuesday, March 14, 1922

Owing to the pressure of other interests, Mr. L. W. Bardsley, Tulare, has decided to make a complete dispersal of his herd of registered Holsteins. Most of the cattle in this herd are young, of good type, and representing most desirable blood lines.

The herd sire, PRINCE RIVERSIDE MEAD, is in the sale. He is a son of the famous King Mead of Riverside, out of a 26 lb. daughter of the century sire, Changeling Butter Boy, next dam a 30 lb. daughter of the century sire, Tidy Abbecker Prince.

THERE ARE 15 DAUGHTERS of Prince Riverside Mead in the sale, and remember that they are granddaughters of King Mead of Riverside.

STOCKMEN'S WEEK

and declared that the results could be duplicated in any other dairy community in California through proper cooperation. Rahl said that the established practices of efficient dairy management were well enough understood but only needed to be applied to the industry and because the industry is essentially a community industry it follows that the adoption of better methods is a community problem.

Mr. Greene states that the dairy industry of this state, which is second in importance, is really only about 20 years old and largely because of the rapid progress made the industry has not yet been developed to efficiency. The big problem, according to Greene is that of economical production and improved quality of product. He urged better sires and the development of cow testing associations pointing out that the dairy business was not different from manufacturing and was governed by the same laws of business.

The dairy program on Friday included talks by the various winners in the dairy cow competition. Noel Negley who has just taken up his work as dairy specialist in the university extension service discussed the practical ways to get results from cow testing associations. J. W. Copini, one of the most successful dairymen of Humboldt County, told of the vital importance of the use of better sires at the head of dairy herds. Copini knew his subject and had the facts to prove his argument. He stated that at the beginning of the pure bred sire campaign in his county a survey was made which disclosed the fact that 28,000 cows were supplying the creameries and condensaries of that county. It was found that the best 14,000 cows had a yearly average production of 339 pounds of butter fat as compared to an average production of 263 pounds by the poorer half. In round numbers this difference had a cash value of \$700,000—most of which could be directly credited to the use of well bred bulls in the leading herds. He expressed amazement that any man could doubt the value of a good sire when it was possible to find on every hand examples as striking as the case just mentioned. He told of 22 herds, headed by pure bred bulls, containing 584 cows, that produced \$157,890 worth of butter fat and 22 herds containing the same number of cows, but headed by scrub bulls, that produced but \$97,815—a difference of \$60,075. Three thousand dollar loss per herd!

Professor F. W. Woll explained the operations of the register of production for grade herds that has been recently established by the university. Dr. G. H. Hart of the veterinary division gave a highly informative talk on contagious abortion.

The week's activities closed with a sale of selected dairy bulls of the four leading breeds. The bulls were from dams with a minimum production of 400 pounds of fat.

Throughout the week an endurance contest for riding horses was carried on. Six horses were entered in the event and were required to carry 200 pounds and travel 40 miles each day. At the close of the contest they were scored on condition, conformation and performance. The winner was a mount owned by Col. A. N. McClure of the army remount service. A list of the winners will appear later.

In reviewing the accomplishments of this week of livestock activities it is probable that the most useful function of the week, so far as the welfare of the industry is concerned, lies in the distribution of a valuable lot of breeding material to go out into service. Another important accomplishment was the launching of the Federated Association of Livestock Breeders, an organization embracing practically every phase of the industry and having for its purpose the furtherance of all propositions calculated to stabilize and improve the industry. The organization will attempt to coordinate all interests and represent the united efforts of livestock men in all matters affecting their interests, whether legislative or otherwise. One of the first actions taken was the adoption of a resolution calling on the board of regents of the university to

increase the efficiency and personnel of the extension division.

It is worth while noting that there was general comment on the improved atmosphere about the institution. Many improvements have been made since last year and an extensive building program is getting under way. The institution is "sprucing up" and there is a very noticeable change in the attitude of the student

THE 1922 GUARANTY SALE

"The Pacific Coast Holstein Classic"

60 SELECT FEMALES and BULLS

This is the fifth Guaranty Sale to be held in California, and the four previous sales have fully measured up to the idea behind their creation—to give buyers an opportunity to select some of the best Holsteins in the west from an offering that has been carefully picked from leading herds.

There will be a wonderful collection of young females in this year's offering, ranging from open heifers up to four year olds, and a few mature cows of excellent breeding and type. The sale will be held on

Wednesday, April 5, 1922

at

Rhoades & Rhoades
Sale Pavilion
Hynes, Calif.

This is the opportune time to buy foundation breeding Holsteins, when the future of the business was never brighter, and the cattle in this offering are essentially foundation material of wonderful quality.

Cattle for this sale were selected by R. A. Condee, Chino; Kenneth W. Abbott, Los Angeles; W. J. Higdon, Tulare; J. M. Campbell, Escalon; F. L. Morris, Woodland; and C. L. Hughes, Sacramento, acting as a Committee for California Holstein-Friesian Association.

body and a more confident and hopeful feeling on the part of the faculty. The new spirit on the part of the students is especially fine. Indeed the boys made the week possible for without their help—and they were everywhere at the right time—the meetings and sales could not have been conducted in such orderly fashion.

The week developed the fact that lack of accommodations for housing the guests and a suitable place to hold meetings and sales is of pressing importance and will continue to limit the development of this annual event. Most of the guests were not backward in declaring that the time has come when the university farm should be equipped with a large sale and show pavilion in which the sales could be conducted and large meetings housed. The business interests of Davis need to bestir themselves in making arrangements for housing visitors. Without a good hotel the growth of the university farm, their principal asset, will be retarded. There is little question but that the housing situation has kept many visitors away. Probably a solution to the problem can be effected by arranging for the Southern Pacific to run one or more special trains between Sacramento and Davis. The distance is only 12 or 13 miles.

Another factor in considering the future of this event is the need of closer cooperation between the various organizations and the university. So far the university has carried the load. The institution can only provide the equipment and the program; the different organizations must furnish the attendance.

Stockmen's week is a distinct credit to the many members of the college staff and that their work is appreciated was evidenced by the stirring tribute paid Professor Gordon H. True at the close of the annual dinner when the crowd stood and gave him three big cheers and a tiger.

GREAT BERKSHIRE EVENT

BERKSHIRE men of the coast were guests at Riverside during the early part of this week. It was the first American Berkshire Congress sale held in California and likewise one genuine display of blue ribbon stock. We are unable to give full particulars of the event but a wire comes from Geo. A. Stingle just as we go to press in which he says:

"In the first American Berkshire Congress sale held in California, Grape Wild Rose Sixth, a California bred sow sold for four hundred and seventy-five dollars; twenty-one head sell for average of one hundred sixteen dollars ninety cents, highest average for pure bred hogs in the west for the year. Seventy-five high school students compete this morning in a Berkshire judging contest for Southwestern Berkshire Congress silver loving cup. Chas. M. Talmadge, nationally known Berkshire breeder and judge will place the awards this afternoon at the second largest Berkshire show ever held in the west. One hundred fifty-seven head on exhibition. Hogs from Iowa, Washington, Indiana, Oregon and California competing. Buyers in sale paid premiums for animals expected to win in today's show. In addition to seven silver trophies donated by progressive Southern California business firms, six hundred and fifty dollars premiums in Tuesday's show will be paid in gold. Two hundred Berkshire boosters took the hills in high Tuesday night at a roast Berkshire pig banquet at Glenwood Mission Inn."

FARM BUREAU HOG AUCTIONS

The California Farm Bureau Marketing Association announces fat hog auction sale dates during March: Wednesday, 1, Modesto; 2, Chowchilla; 3, Fresno; 4, Wasco; 7, Tulare; 8, Visalia; 9, Hanford; 10, Corcoran; 14, Merced; 15, Turlock; 16, Madera; 17, Fresno; 18, Bakersfield; 21, Tulare; 22, Visalia; 23, Hanford; 24, McFarland.

Guy H. Miller of Modesto reports the shipment of a carload of registered Jersey bulls from Modesto to Humboldt County. These bulls were for the Humboldt County pure bred sire campaign and were selected for the dairymen of that county by Prof.

V. C. Bryant of the state agricultural college and John W. Coppini, well known dairyman and Jersey breeder of Ferndale. The Jersey breeders of San Joaquin Valley take considerable credit to themselves for having furnished 24 young serviceable bulls of excellent type and breeding to meet the requirements of the selection committee. The bulls were picked from the herds of J. E. Thorp of Lockeford, N. H. Locke Company of Lockeford, G. A. Moore of Ripon, D. T. Wieland of Valley Home, C. D. Hayworth of Modesto, D. F. Conant of Modesto, C. L. Jarrett of Modesto, H. McComas of Modesto, R. E. Gilman of Modesto, W. J. Hackett of Ceres, E. E. Greenough of Merced, A. A. Jenkins of Tulare and Guy H. Miller, Modesto. They represent the best of California breeding. They should prove a valuable addition to the dairy cattle interests of Humboldt, a county already noted for its herds of high producing Jerseys.

The Western Irrigation Equipment Association will hold a meeting at Fresno, March 11, with banquet in the evening.

1922 PULLETS

Specializing in White Leghorns of the best heavy laying breeds for commercial egg production of proven ability.

Breeding, incubating, brooding and developing of birds by the most efficient methods known.

No other farm in the Southwest offering you entire capacity of pullets raised with equipment approved by U. S. Experimental Farms as best by test.

HEADQUARTERS FOR GOOD HARNESS

The Lichtenberger-Ferguson factory is equipped with the most complete devices for the economical production of quality products. Unsurpassed workmanship, advanced designing and the use of special-tanned oak leather permits the making of worthy harness.

The Reputation of Superior Harness Reaches Back Over Half a Century

THIRTY years prior to this Company's incorporation in 1900, the reputation of Superior Brand Harness was founded. Back in 1870 Louis Lichtenberger, Sr., established the first buggy and harness shop in Los Angeles. From that modest beginning has developed a great manufacturing organization devoted to the production of what we firmly believe is the finest quality harness and saddlery to be obtained anywhere. Today more horses in California are wearing Superior Harness than any other type—a significant tribute to the quality, merit and enduring characteristics of this Brand.

Copy of our new Booklet entitled "Horse Profits" upon request

Cows Not as Warranted

I bought two cows at a public sale, the catalog of which stated that all animals would be sold as sound in every way. Two months after the sale the animals reacted to tuberculin test. I gave my note for a part of the purchase price and have tried to induce the vendor to take the cows back but he refuses and intends to sue for payment. What can be done?—Subscriber, Strathmore.

It would appear from the facts stated that there was a clear warranty that the cows were healthy. The fact that they reacted to the test would seem to indicate that this warranty has been broken. You can undoubtedly counterclaim in any act upon the note the difference between the value of the cows as they are, infected with tuberculosis and that which they would have had if they had actually been sound.

Mother Can Make Will

Prior to my father's death he deeded all property to my mother. Was this lawful? Do not the children have any rights? My mother remarried and invested money in a grove in which my stepfather put in one-third. The deed is in my mother's name. In case of her death how would my stepfather be

able to claim his share? Can my mother will all of her property to other relations and cut off the children?—Subscriber.

If the deed was properly delivered prior to death it would probably be valid although sometimes upon close investigation it has been found that the transaction could be overturned. In case of the mother's death it would doubtless be very difficult for the stepfather to secure share of the property as the presumption would doubtless arise that he made a gift of his one-third interest, since the property stands in the wife's name. It would be a matter which would have to be determined upon all the evidence by the court. If your mother decides to convey her property as she states and is in her right mind she can doubtless do as she sees fit by will.

Liability of Cooperating Members

In cooperative organizations incorporated in California are all members equally liable for the indebtedness incurred during the organization or is each member liable according to his interest at its termination?—Subscriber, Hemet.

There are several provisions concerning the organization of these associations, provisions varying to some certain extent. In at least two the law provides that the articles of incorporation may set forth by general rule that the property rights and interests of each member shall be equal or unequal and if unequal the property rights and interests may be by this

general rule fixed and determined. On the other hand under the general rule of liabilities of stockholders or members it is provided that in a corporation having no capital stock each member is individually and personally liable for an equal share of its debts and liabilities. It would seem that it is possible that these two sections of the law conflict to a certain extent and the writer cannot authoritatively state which would prevail. It is however the opinion that members would be liable in proportion to the interest which they hold. This liability undoubtedly is for only that proportion of the debts and liabilities which he contracted or incurred during the time the party is a member. Thus a member who purchases the interest of a prior member would not be liable for debts contracted prior to that time, except, of course, insofar as the assets of the corporation are liable. His interest on the windup of the corporation will be taken to pay the debts, but he would not be personally liable.

Homesteading

How can we homestead our land? What is the benefit and is it an expensive proceeding?—Subscriber, Bakersfield.

In order to select a homestead the husband or other head of the family or in case the husband has not made such selection, the wife, must execute and acknowledge in the same manner as a grant of real property a declaration of homestead and file the same in the office of the county recorder of the county within which the land is located. The declaration must contain a statement showing that the person making it is the head of the family and if claimant is married, the name of the spouse, or, when the declaration is made by the wife, showing that her husband has not made such declaration and that she makes the declaration for their joint benefit; a statement that the person making it is residing on the premises and claims them as a homestead; a description of the premises and an estimate of the actual cash value. The total expense including the costs of having an attorney draw up the declaration and recorder's fees should not exceed \$10. The homestead after recording is exempt from execution or forced sale up to the amount of \$5,000. In case the selector is the head of a family, upon the death of either husband or wife, if the property constituting the homestead was community property, the land so selected vests in the survivor, or if the property was separate property of the spouse making or joining in the homestead, the land likewise vests in the survivor, without the necessity of probate proceedings.

Rented Horse Stolen

Some time since I rented a team of horses and wagon for a year. The party who hired the horses claimed that one was stolen. In any event it was never found. He told me that he would pay for her but has never done so. Can I maintain action to collect value of the stolen horse and in what county would it be necessary to bring it?—Subscriber, Kern.

The hirer must use ordinary care for preserving property. If he has so used such care as a person would use of his own property and nevertheless one of the horses was stolen, he would not be liable for the value of such horse, although if he promises to pay for such value it might be that action could be maintained upon the promise. Such action would have to be taken in the county wherein the hirer lives. But it is rather doubtful in this case

McQUAY-NORRIS PISTON RINGS

Give Your Engine More Power—and Save Gas

Gas that leaks past worn or poorly designed piston rings is a dead loss. It wastes power and money. That's why it pays to replace leaky rings with McQuay-Norris equipment. It will increase power, save gas and oil, and decrease carbon trouble in any passenger car, truck, tractor, or stationary engine. The McQuay-Norris line is complete for every need. Through the addition of McQuay-Norris Wainwright

Pistons and Piston Pins to the McQuay-Norris Piston Ring line, you can now secure for your gas engines complete McQuay-Norris-made Pistons, Piston Pins and Piston Ring equipment.

Made of Electric Iron

after the delay that action could be successfully maintained unless delay is adequately explained.

Securing Road

One party desires to have a county road laid adjacent to his property. Can he force neighbors to sell a right of way, and if so can the owner of the land set his own price for the right of way, or how is it managed?—Subscriber, El Monte.

The supervisors have general supervision over all oads within the county and may cause such roads to be lald out as are necessary for the public convenience. They are also authorized to acquire a right of way by condemnation proceedings. If you object to the development of this road it would be well for you to first contest the matter before the supervisors, and if you keep a vigilant eye upon the board you may avoid the bill being put through. In the event the board does decide to put the road through there are several means whereby the value of the land is ascertained. Parties wishing to have the road may donate the land or they may set a price agreeable to the county, or if this cannot be done, then the county must bring a suit in condemnation in the superior court and in such action the value of the land may be ascertained in two ways. First, by three referees to be appointed by the court, or, if that is not satisfactory to the land owner, then the evidence as to the value of the land is produced before a jury and the jury awards amount of compensation which must be paid by the county.

Rights of Undivided Interest

There are two owners of an undivided interest in a farm. Can one without the knowledge or consent of the other place improvements thereon and the other be forced to pay his share of the expense of the improvements? Could either dispose of or sell the property without the consent of the other?—Subscriber, Owenmouth.

If the expenditures are absolutely necessary for the benefit or preservation of the common property it is probable that the co-owner making them could recover from the other, but generally a co-tenant is not responsible for the cost of improvements or repairs upon the common property unless he agreed to their making or ratified the act of making them. Where the expenditures do not inure to the common benefit of the common estate there is no right of contribution. One co-tenant of course has no right to incumber or dispose of the common property without the consent of the other. In fact, if the common estate appeared on the title any conveyance which one might make could affect only his undivided one-half interest.

GATHERING PINE SEED

By R. R. McLean

That there is some well defined program mapped out for the reforestation of denuded portions of Los Angeles County watersheds appears to be evident from the quantity of pine seeds that are being planted there. On a recent trip to Jullan, San Diego County, the writer saw a bin containing 6,000 cones of the Blg Cone or Coulter's pine (Pinus Coulteri), that had been gathered for shipment to Los Angeles. These cones are cut from the trees in the fall before the scales open and are stacked or piled under cover. On warm days they are spread on a canvas in the sun and as the scales open the curiously winged seeds drop out. It was estimated by M. J. Jacobs of Julian, whose two boys have the contract with Los Angeles County for supplying the cones, that from 10 to 12 cones are required to furnish a

pound of seed. Figuring on this basis, from 500 to 600 pounds of seed were contained in the 6,000 cones. It is estimated by the writer after weighing and counting a quantity of seed that each cone contains from 125 to 175 seeds weighing about an ounce and a half. Carrying this estimate out further it means that not far from 750,000 seeds will be available for planting out of the 6,000 cones. Many of the seeds, however, are destroyed by the larvae of some undetermined insect, so that the number of sound seeds will be considerably less. The Big Cone pine is said to bear the heaviest of all the fruits of the pine, weighing up to five or eight pounds. The seeds are rich in sugar and oil and are occasionally used as food by the Indians. The wood is not of high quality but is of rapid growth.

The Chuckawalla route from Mecca to Blythe rather than the Butterfield trail is favored by the Riverside County highway committee.

ARIZONA'S CROPS IN 1921

Revised estimates of the acreage, production and farm value of Arizona crops in 1921, as reported by the Arizona cooperative crop reporting service, are as follows:

POULTRY

Profitable Poultry News—Capacity 200,000 Chicks—hence prices surprisingly low for quality. One recent order of a Farm Advisor's was 5000 White Leghorn, 2500 Brown Leghorn, 850 Red Chicks. Farm Advisors are leading Agricultural College graduates and practical experts employed jointly by National, State, County governments. His orders are coming after two years' extensive trial of our chicks throughout his county. These strains 180-290 egg Leghorns, Rocks, Reds, Anconas, Wyandottes, Minorcas, Andalusians, Brahmas, Orpingtons, Ducks, Turkeys, yearly lead many egg-laying contests, supply foundation stock, fill repeat orders for hundreds. Why? Electric hatched, vigor, growth, winter-laying, profit, guarantee. Booking for immediate, future delivery, below pre-war prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 North Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is QUALITY, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

Sly's Old Mission Strain Rhode Island Reds: Winners San Fernando first cock, first cockerel, second hen, third pen. **VENTURA:** First and second cock, first hen, first and third cockerel, first and second pullet, first and second pens. Two silver cups best male and best female in entire show. Hatching eggs from grand matings. Descriptive booklet free. **Albert Sly, 1642 C. Middleton Place, Los Angeles.**

We Are Now Booking Orders for S. C. White Leghorn Baby Chicks, from strong, healthy, vigorous stock. Bred especially for heavy egg production, from two hundred to two hundred and eighty egg strain. If you want strong, healthy baby chicks, place your orders with the Vineburg Hatchery. All baby chicks guaranteed safe delivery. **Vineburg Hatchery, Vineburg, California.**

Santa Cruz Chicks: Our Specials are White Leghorns, Buhrman's White Wyandottes and "Hill Crest" Reds, but also hatching choice Brown Leghorns, Anconas, Buff, White and Black Minorcas, Barred and White Rocks and Reds, Buff Orpingtons. Interesting folder ready. **B. W. Archibald, Soquel, Santa Cruz County, California.**

White Leghorns: Eggs for hatching our specialty, produced right, selected right, shipped right; 100 per cent fertility guaranteed. A laying strain of proven merit. Prices very reasonable. Send for folder, "Secret of Success." **Curtis White Leghorn Ranch, R. 1, Box 29, Gardena, Cal.**

Setting of Buff Orpingtons and Speckled Sussex \$5.00 each. **Bronze Turkey** eggs 50 cents, and **Pekin Duck** eggs 25c each. We only keep one kind, the best, as our winnings at the State Fair and Oakland prove. Address **Braemar Ranch, Santa Barbara, California.**

PROMPT PAYMENT!

The senate has just passed a bill to reimburse the city of Baltimore with \$173,000 expended in works of defense during the Civil War.

DR. HESS Instant Louse Killer Kills Lice on Poultry and Stock

Use it on your lousy hens and chicks—your lousy colts, horses and cattle. You'll get better chicks—bigger, better fowls—more eggs—better contented stock.

Chicks are apt to be lousy now. Give them a chance. Sprinkle Louse Killer into the feathers, about the coops, on roosts, in nests of laying and setting hens. Always keep Louse Killer in the dust bath. For lousy horses and cattle, colts and calves, stroke the hair the wrong way and sift in Louse Killer.

We authorize dealers to return your money if it does not do as claimed.

1 lb. 30c, 2½ lbs. 60c (except in Canada)

Cooperation Wins Out

By Jean A. Koethen

COOPERATION" was the slogan of the annual meeting of the Poultry Producers of Southern California, Inc., held recently. Voiced by individual members in their resolutions of appreciation and confidence and in stirring short speeches from the floor by the retiring president, J. M. Davison, in his eloquent and forceful annual report, by Austin O. Martin, representative of the state market director, and by the president of the Poultry Producers of Central California, J. H. Barber, as he described the magical growth of the poultry industry in California in the last three years, it permeated and directed the current of the meeting. Mr. Martin's statement that the Poultry Producers is the most solvent marketing association on the coast today was received with applause. That the past year has been one of unusual difficulty, on account of the general drop in prices,

are forced to compete with each other. A federation of these organizations, with an office in New York, would go far to prevent friction and unnecessary price cutting, and the meeting voted unanimously to support the plan.

South Consumes Most Eggs

According to Manager Stanley, conditions around Los Angeles are unique, in that during a considerable part of the year the city consumes nearly all the eggs it produces. "The surplus this year will all go east," said Mr. Stanley, "except what is eaten here. Increase of population won't eat up the surplus, but increase of consumption on account of lower prices will." In other words, supply and demand are on a sort of perennial teeter board. When eggs are dear the public refuses to eat them, and there is a surplus which must be shipped out. The fact that there is a

POULTRYMAN'S CALENDAR—MARCH, THE BROODING MONTH

In March the world is full of chicks. Some are brooded by hens, and they are lucky. Many, many more are brooded around oil or coal stoves and under electric hovers. In brooding large flocks it is well to remember always that the bigger the flock the more exacting care it requires. Overheating, overfeeding, lack of ventilation, want of cleanliness, want of exercise are all fatal. The first week adequate heat is imperative. Most of the chicks that show symptoms of diarrhoea the first and second weeks have been chilled the first three days. Thermostats are not always reliable. Even the mother hen may fail to keep her babies warm. The only test of their comfort is the behavior of the chicks themselves. If they are peeping, huddling against one another or standing humped up in a corner they are almost certainly not warm enough. If they lie spread out comfortably on the floor they are warm. Chicks that are comfortable look comfortable.

As soon as chicks are past the first four critical days get them into the cooler playroom and then onto the ground. Dampness will not harm them if they have a warm dry place to which to retreat. Indeed, fanciers say chicks do better on damp ground than on dry. The more range your chicks can have and the more green stuff in the shape of growing barley, grass or weeds, the more rapidly will they grow and the more symmetrical will be their development. The chick is not a hothouse plant. It is a live creature, with blood and bones and lungs, and needs contact with Mother Earth and a chance to fill its lungs with oxygen.

Feeding is a simple matter if environment is right. Chick feed, bran, rolled oats, sour milk, after the first week a good growing mash containing bran, corn meal, beef scrap, ground bone, shorts and any other ingredients suitable for chicks will bring them right along if only they have fresh air, exercise, sufficient heat at night, cleanliness and room to grow.

was acknowledged by all, but the willingness of the poultryman to shoulder his own burden and then to help carry that of the other fellow was a large factor in turning threatened defeat into victory.

The story of the violinist who shattered his violin because it gave out one false note was used by President Davison as an illustration of the vital need of harmony in any organization. If the organization is founded on right principles the individual must be willing to sacrifice something of his own wishes and desires for the good of the cause. That the hundred or so association members present were in hearty sympathy with this idea was evidenced by the vote of thanks which was called for by J. J. Forbrich of San Gabriel and enthusiastically accorded.

How Many Eggs Next Year?

During 1921 the association handled 4,703,440 dozen eggs, receiving for them \$1,472,049. What of 1922? According to President Barber of the Petaluma (Central California) organization, last year showed an increase of 25 per cent over the previous year, and 1922 will show a similar increase. In 1921 there were shipped out of California 1,100 carloads of eggs, containing 550,000 cases, and reports from New York show that 900,000 cases of Pacific Coast white eggs were handled in that market. In other words, 12 per cent of all the eggs that went into New York in 1921 came from the Pacific Coast. The coming year there will be more, and the question is, What is to be done with them? For the purpose of answering this question, in part at least, a meeting was held in San Francisco on January 16 to consider the advisability of a more extended federation of producers. There are now five poultry organizations on the coast, at Seattle, Portland, San Francisco, Los Angeles and San Diego. All these organizations ship eggs east, and they frequently

surplus starts prices down, and as soon as the consumer finds eggs are within reach again he begins to eat, thus consuming the surplus and starting prices upward once more.

Consumption as a whole in Los Angeles has actually increased more rapidly than production. This is proved by the fact that last year 110,000 cases of eggs were shipped into the city, which is twice the number imported in 1920.

Improvements

Two improvements which have been made this year deserve special mention. One is the sandblast method of cleaning eggs, which has been worked out by two young engineers, cooperating with the Poultry Producers of Central California, by means of which three or four machines do the work of 75 women. The other is a new method of processing with oil, which has been tried out by the Southern Association and seems to be the best process yet devised for keeping eggs.

Profitable Year

In spite of handicaps the year's profits were so large that one cent per dozen, a total of \$47,000, will be returned to the producers. At the beginning of the year it was believed 2½ cents per dozen would be required for expenses of handling, but this toll was later reduced to two cents, and the return of one cent per dozen reduces it still more. "It must not be forgotten," declared Cornele G. Ross, the incoming president, "that the Poultry Producers of Southern California is ourselves. Any charge made for handling or for cases is returned to the producer if it is not needed. If you think the officers are wasting your money, jack them up once in a while or get a new board of directors. Come into the board meetings and learn how your money is spent. Make suggestions if you can." The average of the Los Angeles mar-

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus Bacterium Pullorum transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort, I sent to the Walker Remedy Co., Dept. 598, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 598, Waterloo, Iowa.

Baby Chicks

Place your order now for early spring chicks. We can ship any number. All popular varieties hatching each week. Complete line of supplies. Send for price list. All breeds of puppies, kittens, birds, pullets, pigeons, rabbits and pet stock.

Rid Setting Hens of Lice and Mites

Wonderful New Remedy Banishes Lice and Mites Without Dusting, Spraying or Greasing.

Lice and Mites cause many poor hatches. Setting hens, infested with them, will often leave their nest at the most critical time. Many dusts, sprays and dips are so strong that they often make eggs unhatchable. It is now easy to keep your setting hens, as well as the rest of the flock, absolutely free from all lice pests, and that too, without any trouble of dusting, spraying or greasing. Setting eggs in no way affected.

A few drops of this wonderful Imperial Lice and Mite Remedy given occasionally to fowls in their drinking water, keeps them entirely free from all vermin. It is guaranteed not to affect the eggs or flesh. On the other hand, it acts as a splendid spring tonic and blood purifier. Lice, mites, ticks and other vermin positively will not stay on any fowl that takes this remedy.

Fine for Baby Chicks, Too

By all means protect your entire flock, especially setting hens and baby chicks, from the ravages of Lice and Mites by using this wonderful discovery—Imperial Lice and Mite Remedy. You can do so without risking a cent, as it is fully guaranteed.

White Diarrhea Remedy Free

Send only \$1.00 to the Imperial Laboratories, Dept. 529, 2110 Grand Ave., Kansas City, Mo., for a regular full sized, (double strength) \$1.00 bottle, postpaid. And further, as an outright gift to acquaint you with its merits, they will also send you entirely free, a regular \$1.00 package of Imperial White Diarrhea Remedy. If more convenient, you need send no money; you can pay the postman \$1.00 and a few cents postage on delivery of the package containing the two remedies. You need not hesitate to accept this offer, as the return of your money is absolutely guaranteed if you are not entirely satisfied.

This damper regulates your check draft and the direct draft to your fire.

STAWBERRY PLANTS

That Please the California Fruit Grower. G. J. Streicher, Napa, Cal., writes: Jan. 7-22. Received strawberry plants today to fine shape, they are nice clean, well rooted stock. The inspector said they were the best rooted plants he had ever seen.

Our New 1922 Catalogue describing more than 25 varieties and containing other information now ready for your FREE copy quick.

V. R. ALLEN, Seaford, Delaware

ket is two cents above that of any other market on the coast, a condition due mainly to the efficient work of the association.

Directors and Officers

The following directors were elected from the various districts:

Gardena, H. M. Stone; San Bernardino, east, J. O. Snyder; San Bernardino, west, Sarvin M. Kirk; Pomona, Cornele G. Ross; Van Nuys, B. R. Horloway; San Gabriel, R. V. Senior; San Diego, T. M. Hurley; Orange, S. H. Druce; Burbank-Lankershim, Ralph Stockton; Riverside, C. R. Brown; representing state market director, Austin O. Martin.

The retirement of J. M. Davison, who has served as president since the organization of the Poultry Producers, in 1916, is a matter of great regret to all who have worked with him during these five years of struggle and achievement, and his splendid leadership, to which the association owes so much, will be missed. In the incoming president, Cornele G. Ross of Pomona, he has an able successor, a poultryman who has endeared himself to his own community by his integrity and helpfulness, a careful student of poultry husbandry, a man whose sincerity and winning personality command the respect of all.

Poultry Queries

Conducted by Jean A. Koethen

Jersey Black Giants

Will you kindly give me the name of the Riverside man who breeds Jersey Black Giants?—Subscriber, Huntington Beach.

As far as I know, J. F. Backstrand of Riverside is the only man in Southern California who has this breed.

Squabs for Market

Will you kindly give me information as to the raising of pigeons for markets and the cheapest and best way to begin? Is it easy to find a market for squabs and are they profitable?—Subscriber, Petaluma.

I have mailed you a copy of the Cultivator of November 12, 1921, which goes into these matters quite fully. The best way to begin is to buy the pigeons already mated in pairs and guaranteed to produce young. The market, breeders say, is not steady, more because there is not supply enough to fill a steady demand than because squabs are not wanted. Hotels, clubs and restaurants are the chief consumers.

Weak Leg

Our chicks, now two weeks old, have developed leg weakness. When standing they tremble as if they were going to fall, and often do. They walk as if they had hardly any control of their legs. We feed mash and grain mixture according to university recommendation. Chicks have had buttermilk, clean water, air and exercise. The chicks eat to the last breath and die with full crops. We had 1,000 in this hatch—Subscriber, Pomona.

In spite of the very excellent care your chicks have had I can't help thinking they have not had the exercise, and particularly exercise on the ground, which they need. The fact that they eat so well shows that they have no real disease. Get them out onto the ground where they have ample room to run and a chance to peck at green growing things. Add bone meal and rolled breakfast oats to the mash (not more than 5 per cent bone meal, but as much of the rolled oats as your conscience will permit) and feed all the sprouted oats they will eat up in 15 minutes once a day. They are putting on fat more rapidly than their bones and muscles develop, and the oats and bone meal will help to correct this deficiency. It is also a good plan to add 50 per cent plain bran at first to the mash you are using.

Roosting in Trees

I have 30 to 40 hens roosting in trees all winter, and they will not go in. Some poultrymen tell me they will lay as well out as in but will eat more. Others say they will not lay.

(Continued on Page 255)

Motorcycle "Express" to Town

WHEN you've got to get to the railroad station or post office in a hurry—when you want a sack of feed or some groceries from the store—when you have to get to the far end of the farm or to your neighbor's and back before dark—you can't beat a Harley-Davidson.

You can't beat this sturdy motorcycle for economy and all 'round dependability. Rides comfortably—easy to handle—even on roads that would stall an automobile. The roomy side car carries a surprising amount of luggage. Thousands of farmers have their Harley-Davidsons in use almost every day of the year—paying big dividends in time and money saved.

50 miles for a dollar—gas, oil and tires—is the Harley-Davidson's average performance. That's REAL economy. Ask your dealer for FREE demonstration, or write us for illustrated literature. No obligation to you.

Attractive dealer proposition for unassigned territories. Address Desk A-2.

WESTERN CANADA Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying

are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

Perforated Tree Protectors

Are you planting GRAPE CUTTINGS this season? We can save every one of them from rabbits, also every fruit tree from pest, hot sun and sand storms. We make a number of kinds. Tell us your pest. We will tell you what to use.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, over disturbing the roots of the plant or stopping its growth a single hour in transplanting. For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cucumbers, Cauliflower, Cantaloupes and Squash, also for Avocado, Carob Tree, Eucalyptus and Olive Cuttings. It's the most practical pot in use today for propagating work of any kind. Write us for samples and prices of both pots and protectors. Tell us which you are interested in.

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

YOU never feel a jounce or bounce

Riding all day on an ordinary tractor seat is a tough job even under the best of conditions. The constant swaying and jarring are torture for the back and bad for the health.

Equip your tractor with a Seibel Air Spring seat and note the marvelous difference. Every kind of land seems soft and smooth, all vibrations, swaying and jarring are gone. Sudden rebound when crossing furrows or ridges is absolutely eliminated. That's why you will feel 100% fresher and better at the end of the day's work.

INEXPENSIVE—put on any tractor in a few minutes. Note the bucket seat with back rest.

MONEY-BACK GUARANTEE—Write to the nearest dealer or to this company direct for further information and our money-back-guarantee offer. Give name and model of tractor.

POULTRY QUERIES

(Continued from page 253)

What is your opinion?—Subscriber, Napa.
So few hens are allowed to roost out of doors nowadays that I have not much data on which to base an opinion. Hens that roost in trees are sure to be hardy, and they will surely eat more than hens confined to a house because they have to maintain the heat of the body under rather adverse

conditions. On the other hand, they will not be subject to roup or colds. If your hens have been out all winter you ought to be able to compare their egg production with that of the average confined flock. Thirty per cent in November and December and 40 in January increasing to 50 by the end of February is a good flock average. Have your hens done as well? If they have not it is safe to conclude that tree roosting has to some extent been detrimental to production.

Turkey Hovers

I wish to ask about the wire brooder boxes used by Mrs. T. T. Middleton for her pullets. Were they made entirely of wire mesh? Would a feather duster answer for a hover instead of the strips of flannel?—Subscriber, Mountain Ranch.
The boxes were entirely of inch mesh wire, if I remember correctly. I have heard of brooding turkeys with a feather duster but never tried it. I think I should prefer a live hen. If you are going to raise a good many turkeys I think you would find a regular brooder house with 100 chick brooders more satisfactory than this

semi-fireless method. Mrs. Middleton was putting in a regular brooder system last fall when I called at her ranch.

Sprinkling Turkey Eggs

Do turkey eggs need dampening every day when they are hatched in an incubator?—Subscriber, Mountain Ranch.
Follow the directions in your incubator book. It is customary to sprinkle turkey eggs with warm water two or three times the last week of incubation when they are under hens. If there are no directions with your machine you can safely do this, moistening well and closing the machine the 26th day.

Store Grain On Your Ranch

Sell when and where you want to

SOME RANCHERS make more profits than others simply because they market their grain to better advantage. Progressive ranchers are familiar with the greater profits that go with bulk handling. Many, however, have not investigated the further profit possibilities that go with storing their grain in bulk right on the ranches.

More profits lie in being able to hold your grain and sell it when and where the best price can be obtained.

If you are paying storage bills and insurance premiums, it is hard to wait for a favorable market.

If you have shipped your grain to a northern point to be held in storage, you cannot always afford to sell to a southern buyer and pay freight back over the same line. And vice versa.

So, store your grain on the ranch in fireproof, Calco Metal Grain Bins. Avoid storage costs and double transportation charges. Sell your grain where and when the price is best.

Write for complete information on Calco Metal Grain Bins.

Big Stock Reduction Sale

ORDER AUTO ACCESSORIES BY MAIL

For the first time in our history we are able to offer Stephens tires at these ridiculously low prices. Factory production has been maintained in order to keep up the standard of quality and keep down the price for the benefit of Stephens users—this has resulted in large overstocks in the East. These overstocks had to be moved—so we moved part of them this way to permit our patrons to take advantage of this wonderful offer. Here is the BIG OPPORTUNITY to completely equip your car with high-grade, brand new tires.

MAIL ORDERS will be given prompt attention. Your satisfaction guaranteed or your money back. Nothing could be fairer. Out-of-town customers can benefit greatly at these prices. But send your order in early to Dept. C4.

Planet Jr.

Make the orchard pay board

The Planet Jr. No. 41 Orchard and Universal Cultivator makes cultivating the orchard a paying proposition. It does the work of both spring tooth and disc harrows, yet is very light draft for this heavy work. Not only for the orchard, but for working fallow ground, hilling beans and potatoes, running irrigation ditches, it is a valuable, economical implement with a wide variety of uses.

Write for catalog showing complete line of famous Planet Jr. seeders, cultivators, wheel hoes, etc.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fall to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

A Butte County patriarch graces our cover this week. It is an almond tree 40 years old when the photo was taken and of a height and size we can only approximate by comparison with the figures of the two ladies. Note the one lady standing up in the tree and handing down a spray of the bloom to the lady—we believe it is the late Mrs. Bidwell—who is standing on the ground. This photograph was taken some years ago. The tree still stands in Bidwell Park, Chico, Butte County.

This is positively the last time we will suggest the propriety of making out the income tax return for the year 1921. The return must be in the hands of your tax collector not later than midnight of Wednesday, March 15, though we believe there is a possible exception when in case of death or serious illness a thirty day extension may be secured if arranged in advance. But the best way is to have the entire matter over with and the return in the hands of the collector. Unfortunately with most of us the awful complications of the blank which is given

to us for the making out of these returns give us more real sorrow than the amount of money we have to hand over to Uncle Sam.

As time elapses the damage to subtropical fruits and garden truck because of the January freeze may be more accurately estimated. As a rule the amount of injury does not equal that of 1913. It now appears there will be a vastly greater amount of fruit shipped than there was after the 1913 freeze. However, there are some lemon orchards which are so seriously injured that they may be either replanted or, more likely, will give way to other crops. Commissioner Ryan estimates Los Angeles County's loss as "Not less than 60 per cent of the Navel crop as a result of both wind and frost." The Valencia loss, however, will be lighter, not exceeding 50 per cent.

As a rule orange growers and shippers are insisting on the protection of California's good name for sending only thoroughly good, dependable, standardized products to the market. The moment it was known the recent cold spell would seriously injure some fruit growers and shippers met and agreed that the good name of the state was more important than the immediate profit. Appeal was made to Director Hecke of the state department of agriculture and his deputies were immediately on the job aiding shippers in preventing the sending of injured fruit. There have been but very few wilfully disregarding the best interests of the state.

The Colorado River bill has been favorably reported back to the senate by the irrigation and reclamation committee. It provides for the appropriation of \$360,000,000 and ultimate development of 6,000,000 acres of land and the creation of electric energy sufficient to supply the entire Southwest. This is generally considered as the first real step in this great project which will mean prosperity to the Southwest and great increase of wealth for the nation.

A subscriber who buys advertised goods writes: "I don't like to patronize people who are afraid to tell what they have and their prices in their ads. When an advertiser says in his ad, 'Write for prices,' I suspect there is some reason. And it is certain to me the plan is a poor one, because the purchaser is subjected to losses in time and the expense of extra postage." We are inclined to agree with the subscriber to an extent at least. When we are looking for a certain article it is certainly most satisfying to read the ad which gives full information regarding the article, price, etc. A letter with enclosed check settles the whole business, and a series of questions is unnecessary. However, there are times when an advertising campaign calls for such large expenditure that fullest information is not possible in the small space available.

EX-COMMISSIONER COLLINS

Charles F. Collins, one of California's pioneer county horticultural commissioners, has terminated his work of fighting the pests of Tulare County orchards and of encouraging growers to more perfectly standardize their packs of California fruit and has moved to Oakland. Mr. Collins will be missed from the ranks of the commissioners when they gather in annual convention. He has been one of the state's most efficient workers. We are sorry indeed to see him quit the game.

CHARLES R. ROCKWOOD

The father of Imperial Valley died at his home in Los Angeles last week. He was the first irrigation engineer to look over the Colorado desert with an eye to its wealth producing power if the Colorado River could be made to pour its wealth over the desert land. He devoted himself to the development of the great Imperial Valley irrigation system and his zeal in that work was intense. He talked and preached of the possibilities of those lands and waters until it was asserted that the first two initials of his name stood for Colorado River; in fact, for years he went by the name of Colorado River Rockwood.

CREDIT NECESSARY

The Federal Land Bank has loaned 4,000 California farm owners \$13,394,400 and it reports that 63 per cent of this amount was loaned for the paying off of loans bearing a much higher rate of interest. But with the great advantage which has come to some farmers because of the land bank there is need for more short time money.

Farming like all other business must be largely financed on credit. There is a normal need for agricultural credit for periods ranging from six months to three years which is not adequately served by our present banking machinery.

This situation has been brought sharply to the attention of the nation by the events of the past two years. Crop proceeds in 1920 and 1921 in many cases did not pay costs of production and living expenses and farmers were forced to become heavy borrowers from commercial banks. To be sure there has been material aid through the efforts of the Federal Reserve Bank and, perhaps more, through the war finance corporation, but this is only a temporary measure and the old, old question of rural credit still calls for consideration.

DIVERSIFY

Farmers usually fight shy of crop control through reduction of acreage. In the first place, with high priced land there is unwisdom in permitting them to lie idle. More, the farmer takes pride in 100 per cent efficiency in producing to the limit what the world needs. But there is a difference between crop control and diversification. Now comes the department of agriculture, which is always engaged in an effort to increase efficiency and total production, and suggests that the only safe policy for the farmers of the watermelon districts, mainly the Carolinas, Georgia, Florida, Alabama, and southeastern Missouri, is to plant only such an acreage of watermelons as they can properly care for and market, devoting their energies chiefly to the growing of staple farm crops and the conducting of a safe and sane policy of diversified farm crop and livestock production. A cropping plan suitable for the watermelon sections should include a moderate acreage in watermelons, not greater than last year, and this should be handled in the best possible manner to produce high grade melons.

California farmers and orchardists have long been discussing, and a few practicing, intensive diversification. Let the acreage be greater and we believe that it will be to the advantage of producers if there is less of dependence on a single crop.

DEZELL MANAGER

The board of directors of the California Fruit Growers' Exchange has unanimously elected Earl G. Dezell to succeed the late G. Harold Powell as general manager.

Some of us who have been visitors at the headquarters of the exchange since its founding recall seeing Mr. Dezell as a youngster working as office boy or taking dictation from Manager Naftzger, later Manager Woodford, and still later joining with Manager Powell in shouldering some of the heavier duties in the management of the greatest cooperative fruit marketing organization in the world. Mr. Dezell has been connected with the exchange for 25 years or since the time when the entire organization shipped only about 2,000 carloads of fruit annually. Last year the organization shipped over 40,000 carloads. During this period, covering more than half of a lifetime, Mr. Dezell has worked in every department of the great organization. Speaking of Mr. Dezell's qualifications President Teague says:

"There is represented in Mr. Dezell all of the qualities necessary in the chief executive of the California Fruit Growers' Exchange. He is able to fill any position within the exchange and has a more complete knowledge of the organization than any other man in it at this time. Mr. Dezell has a great power of analysis of figures and a great ability to eliminate all extraneous matter and arrive at right conclusions. It seems to me a very happy solution of a very difficult situation, and I am sure that the action of the directors will receive from our shippers in the country, from our agents in the East and from the trade throughout the country approval as unanimous as was the action of the directorate itself."

REORGANIZING

The California Almond Growers Exchange is quite like other institutions of human creation. That is, it lacks some of the elements of perfection. It has, as it were, growing pains. As usual the first to become aware of those growing pains is the victim, and Manager Tucker and his board have proposed to administer treatment. In other words, the board of directors of the California Almond Growers Exchange has advised 4,000 California almond growers that the exchange, the parent of 24 local almond growers associations in the state, must liquidate or reorganize along lines voted at a meeting of representatives of the local associations. These representatives adopted new articles of incorporation throwing open to growers direct membership in the exchange and bylaws which include the necessity of a five year crop agency contract between the grower and the exchange.

The exchange announces it will not solicit orders for the sale of the 1922 crop nor will it enter into any selling contract. The exchange cannot go ahead contracting with buyers "until a substantial number of growers have signed the new crop contract." The exchange is entirely free from debt but there has been serious weakness in the hand-to-mouth way in which the business has been conducted. In taking the first step in organizing this great institution it was recognized that growers, while strong for cooperation, were lacking in appreciation of the possibilities of complete cooperation. They could see ahead for one year but five years appeared too long a time. The management, however, sees the futility of continuing former methods and it is now asking that the 100,000 acres planted to 7,000,000 almond trees, representing an investment of approximately \$60,000,000, shall come across and say emphatically "We believe in our own organization, which is now 12 years old, and that it has been efficiently operated and is worthy of our trust and confidence." If the new longer time contracts are freely signed, as it is believed they will be, there will be successful marketing of crops and prosperous almond growers.

California Cultivator

Vol. LVIII, No. 10

Los Angeles, March 11, 1922

One Dollar Yearly

The Nation's Almond Bowl

By S. J. Richard, Sacramento

TAKE of the best fruits of the land in your vessels, and carry down the man a present, a little balm and a little honey, spices, myrrh and almonds.—Genesis 43:11." The development of the almond industry reads like a romance. In tracing its history from biblical times we pass every milestone in civilization's march of progress. Before the time of Christ the almond played no small part in replenishing the larder of the family, and its value was such that for a time it was used as a medium of exchange by the early nations. Then the wars and the wanderlust spirit scattered the ancients and their almond trees withered and died. But the value of this favored nut was remembered and later efforts at propagation and planting again put the almond on the ration list as an appetizing and nutritive food. Today annual production is increasing in all almond growing centers and still the demand cannot be satisfied.

In the fertile soil of the Sacramento Valley where every manner of fruit

and tree grown in the North, South, East and West produces abundantly the almond industry is reaching its greatest development. The climate of the Sacramento Valley and the absence of injurious frosts are large factors in the growth of this California industry. The almond orchards are given constant care as to cultivation, irrigation and sprays from blossom time in early April until the crop is ready to harvest in August.

Much transient labor is required during the harvest which provides employment for thousands. The method of harvest is poling from the trees rather than picking. The nuts are then gathered and sacked ready for shipment to the almond plant. Here modern machinery strips off the hulls and the nuts are treated chemically to kill any possible insect life. Then shells are removed and the meats graded and packed for shipment to world markets.

There are about 100,000 acres in California devoted to the production of almonds. With an annual crop of 7,000 tons and better to be disposed of without glutting the market there has been presented a difficult problem, the solution of which has been accomplished by a selling organization, the California Almond Growers' Exchange, organized in 1910. The work of the exchange has virtually stabilized the industry. It has taught the grower the necessity of cooperation to successfully market large crops and has sustained the planting of additional acreage. It has developed old markets and exploited new ones. The quality of the output has been improved and the element of speculation removed. Foreign competition has been largely met by judicious distribution and by broadening the demand.

Very simple is the plan of operation of the exchange. Its main object

is to market almonds of its members at cost and develop a greater demand for the product. Each member markets his crop solely through the organization and pays his pro rata share of marketing costs and warehouse overhead expense. It acts as a periscope for the industry, detecting the harmful and ever watchful for opportunity. Financially solid, the exchange can advance the rancher money when his crop is ready for market and before any cash is realized for the crop from the eastern markets. This provides sufficient money to meet the rancher's needs until the crop is sold, when further cash returns are made. It maintains a salaried representative in Europe, who reports on European production and conditions that affect the industry. It has brokerage connections in every important market in the United States, Canada and England.

In the heart of California, at Sacramento, the exchange has erected an almond plant and warehouses which represents an investment of \$300,000.

Pears and the Association

From Address by President Frank T. Swett
Before the Canners' League

Constructive Criticism

The management of the Pear Association will at all times welcome constructive criticism. We want to be fair, but to be fair we will have to know what constitutes fairness.

Not long ago one of our best friends among the canners made the suggestion that there was danger that the pear growers, through their interest in marketing pears in eastern markets, might be limiting the canning industry. I was glad to have the suggestion, for it gave me the impetus to look up actual figures.

In the four years previous to the pear association 150,000 tons of pears were shipped east, while during four association years 188,000 tons were shipped. This was a gain of 12.3 per cent. In the four years before an association there were canned 86,000 tons, while during the last four years there were 101,000 tons canned, or a gain of 11.7 per cent. We must remember that the past two years have been very light crops, the crop of 1921 being the lightest since 1913.

Our tonnage figures in the association show that in 1918 our members averaged 7.5 tons per acre, in 1919 9.3, in 1920 7.8 and this last year only 2.8. Frost hit the mountain districts and a discriminating wind blew 7,000 tons of pears off the trees along the river where a large portion of the canneries pears are produced. These figures apply to the entire tonnage, both eastern and canning, so you can see that if we were short of what we should have provided it was from causes that we do not yet know how to control. Even at that you canned 70 per cent of the previous year's pack.

Now a word as to prices: More than half our pears are sold at auction in the East where the buyers themselves set the price. In 1918, the first year of the association, the Sacramento River pears averaged the grower \$80 a ton, unpacked, in grower's packing house. This included about 35 per cent of No. 2 pears. The canner paid us for No. 1 pears what we asked, or \$70 a ton delivered.

In 1919 the average for all Bartlett's shipped east (No. 1 and No. 2) was \$95.46 a ton, and for River pears \$100.57 per ton. We sold you at \$85 a ton for No. 1, or \$15 a ton cheaper.

In 1920 the pears shipped east netted \$113.73 per ton, and the Sacramento River pears \$104.53 per ton.

The canner paid us \$100. It is true that all things were inflated, and it is probably true that we would have all been better off in 1921 had there not been inflation, but even in 1920 many canners paid outside growers a premium over the association price.

In 1921 the River pears averaged net return from eastern shipment of \$79.32; and all the pears from California \$69.69. You paid \$65.

I hope the jury will decide that we have at least tried to be fair.

The Future

Last year was the lightest crop since 1913. There have been two abnormally small crops. Unless all signs fail we are looking forward to the largest crop from the largest acreage ever harvested in California, possibly 130,000 tons as against last season's 78,000. If you will guarantee the weather we will guarantee the supply, and we shall hope for the largest pack that can be safely marketed by you.

During the next five years the total output should continually increase until it reaches 250,000 tons. It will take the combined efforts of all of us to find markets, fresh, canned and dried.

We have an advertising fund on hand. Last summer we experimented in a modest way with advertising and merchandising fresh pears in two cities, Boston and Philadelphia. At an expense of a nickel a box we more than doubled the demand for pears. We did this at a profit. This fall we expect to start to determine what we can do in a modest way toward increasing the demand for canned and dried pears. We are not forgetful of the fact that without increased demand many orchards may become liabilities instead of assets.

In the meantime I have one definite suggestion which will help to start the ball rolling, and I offer it to you.

The housewife pays a nickel more for a can of pears than for a can of peaches or cots. If pears are always to sell at a premium commensurate with the greater cost of canning pears then the housewife should have an extra value shown her to justify the nickel. We can do this in more than one way. But I will suggest today one of the ways.

Victor, presiding genius of the St. Francis, tells us and shows us that "Pear Salad, a la Victor," is a dainty dish fit to set before a queen. I used

to think before Victor got busy, that pear salad wasn't so much. The old fashioned pear salad was a chunk of pear and a hunk of mayonnaise. The ingredients quarreled. Victor's pear salad, on pear labels, will sell more canned pears. One canner has already arranged to use a recipe on his label. If you can see your way toward doing so, then you will start something, without cost, to be supplemented later on by not less than \$25,000 which we have on hand to work along other and more complete lines, next fall and winter.

In closing let me repeat that our association wants to work with each and every one of you in every matter in which our mutual future welfare is at stake. We hope to be able to do, so that some day you will all say, "The Pear Growers' Association is a fair growers' association."

FOLLOWING CALIFORNIA

Speaking before an overflow meeting of the San Francisco Advertising club, at San Francisco, T. C. Tucker, manager of the California Almond Growers' Exchange said:

"We who went from California to the agricultural conference as delegates found California already enthroned there, crowned with the glory of her farmers' achievements in cooperative organization. The most important recommendation made by the conference was national legislation encouraging organization of farmers' cooperative organizations, patterned after the California cooperative.

"Since that recommendation was made congress has passed and the president has signed such a legislative act. We may look for history-making developments along cooperative lines within the next decade.

"I found at the conference that California had suffered less from the agricultural and industrial depression than any other section of the country. I am convinced that her comparatively happy condition today is due to the stabilizing influences of her farmer cooperatives which give the farmer a voice in determining when and to whom he shall sell and at what price. Thus he has been given a fairer share of the consumer's dollar. Back up California's farm cooperatives. They are building a new California."

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County has 2,000 acres in bearing almonds.

Antioch, Contra Costa County, is making plans to secure water supply from Sand Creek.

A tractor school will be held in Sonoma County, April 24-29. Exact location not yet determined.

The Wyandotte, Butte County Olive Association has decided to join the California Olive Association.

Some 40,000 acres will be planted to rice in Butte County this season. Last year's planting was 30,000 acres.

Turkey raisers of Willows, Glenn County received over \$100,000 for birds sold on the holiday market.

The California Almond Growers Exchange is calling on members to sign crop agency contracts running for five years.

The Lincoln highway has been rerouted to run from Oakland through Hayward and San Leandro.

At the hog auction held at Live Oak, Sutter County, by the farm bureau, 104 head brought average of \$10.70 per hundred.

Alameda and Santa Clara County vegetable growers are expecting good returns for their early crop which were little damaged by cold weather.

President O'Brien of the Tahoe-Ukiah highway announces that the state highway has let contracts for second unit of the highway from the Wadsworth slough around Morris Corners.

Several poultry culling demonstration farms will be located by the farm bureau of Sonoma County during May. Culling will be done in June and July. A flock competition contest will also be started in October.

Directors of the Sacramento chamber of commerce have appointed a committee to attempt the settlement of the suit by the city of Antioch and delta land owners against irrigators of the upper Sacramento Valley.

Several farmers in the Concord district of Contra Costa County who pulled up their grape vines are planting wine grapes; also many new vineyards are being set; largely to Zinfandel, Alicante Bouschet and Petite Sirah.

The Placer County farm bureau has elected for the coming year, John A. Livingston, Auburn, president; Henry W. Ahart, Lincoln, vice-president; Maud Elkins, Auburn, secretary-treasurer; J. A. Teagarden, Auburn, state director.

Land owners and business men interested in water development and irrigation or Northern California met with the state water board at Red Bluff, Tehama County, last week. Location of reservoir sites was particularly stressed.

Action on ordinance proposed for Glenn County, regulating amount of irrigation water which may be applied per acre, has been postponed for further consideration. The district attorney gives his opinion that its passage would be legal.

Growers of strawberry plants in the district from Castella to Delta in Shasta County are shipping largely to the Watsonville section. Horticultural Commissioner Stroup says they will send out 3,000,000 vines this season. They are receiving \$10 a thousand.

Central California

The Hume cannery at Turlock has already opened on spinach.

Four carloads of hogs have already been listed for Fresno's Pork Day this fall.

Plans are being made for a farmers' free market at East Bakersfield, Kern County.

Chas. F. Collins has retired from the office of horticultural commissioner of Tulare County.

The Danish Creamery Company will locate a large plant at Tranquillity, Fresno County.

Kern County supervisors have been making inspection of proposed sites for a county park.

A new center of the Stanislaus County farm bureau has been organized at Dry Creek.

Express shipments of fresh figs last season to New York were very profitable when precooled.

Two new cheese factories at Oakdale, Stanislaus County will be operating within a few weeks.

The California Fruit Exchange is planning to build a packing house at Terra Beila to handle this season's deciduous fruits.

Poultrymen of Delano, Pond, Jasmine, Earlimart, Richgrove, McFarland and Radnor held a poultry show at Delano the last week in February.

Kings County chamber of commerce says that county will make exhibits this year at the state fair and at the Southern California fair at Riverside.

Citrus growers of Richgrove, Tulare County are planning to erect a packing house to handle fruit of that district as well as of Ducor and Jasmine.

West Side irrigators will hold another mass meeting at Newman, March 17, to continue discussion of plans for safeguarding water supplies.

Erection of seven grain elevators in the San Joaquin, Sacramento and Salinas Valleys is planned by the California Farm Bureau Elevator Corporation.

Boundaries of the proposed Pine Flat irrigation project were definitely determined at a recent meeting in Fresno. The project is to be known as the Kings River water storage district.

The Tulare County farm bureau directors have organized with ten departments: organization and publicity, citrus, cattle, stock and dairy, deciduous, vineyard, home, marketing, utilities, poultry.

Bakersfield is planning to hold an election to vote on bond issue of \$150,000 to build levees to protect it from overflow of the Kern. The center of the business district is ten feet lower than the bed of the river one mile to the north.

The newly organized Turlock Melon Growers Association has already secured membership of more than 50 per cent of the melon growers of the district. They are preparing to demand cash on delivery for their melons this season.

The March meetings of the farm home department of the Stanislaus County farm bureau will be all day sessions and meetings will be held at Hickman school, March 14; Tegner, 16; Mitchell, 17; Patterson Community Hall, 20; Denair school, 21; Mountain View, 28.

Southern California

Blackbirds are a serious pest in the Imperial Valley.

Large sales of wool are reported from Imperial Valley.

Many additional plantings of cantaloupes and grapes are announced for the Palo Verde Valley.

An additional \$3,000 has been appropriated for use of weather bureau in citrus protection from frost.

The Costa Mesa Apple Growers' Association, Orange County, held its annual election last week and discussed marketing problems.

The Auto Club of Southern California recommends as precaution in keeping the Ridge Route open next winter that snow plows be maintained along the way.

Large contributions of beans are being made in Ventura County for Near East Relief work. They will be shipped March 6 from Los Angeles.

Shipment of peas from Imperial Valley has begun; tomatoes, it is now estimated, will start May 1, about a week later than usual owing to cold weather.

A tractor school will be held at Santa Barbara, March 27 to April 1, by the university extension service. Farm Adviser, Santa Barbara, can supply information.

The Limoneira ranch near Santa Paula is reported to have expended between \$15,000 and \$20,000 in orchard heating; Rancho Sespe between \$10,000 and \$15,000.

T. J. West of the Calxico Compress Company says that present indications point to planting of cotton on 180,000 acres in Lower California with 50,000 on the American side.

Apple and pear growers meeting at Yucaipa appointed a committee of 16 from apple and pear growing districts south of Tehachapi to devise a plan of cooperative marketing.

Members of the McPherson Heights Citrus Association netted an average of \$2.82 per packed box on citrus fruit shipped the past season. The association shipped 336 cars of Valencias.

The dairy department of the Orange County farm bureau has elected as members of its board of managers H. L. Wakeham, F. D. Plavan, J. R. Raitt, A. H. Moore, Steve Griset and M. Babylon.

Water conservation and reforestation are being urged by an association of city and county officials of Los Angeles. Chas. Bayer is chairman and Dr. Geo. Clements of the chamber of commerce, secretary.

Berkshire swine were to be seen in large numbers at Riverside this week during the American Berkshire Congress. 151 head were exhibited. 21 high school students participated in the junior judging contest.

Honey producers met in Riverside recently to discuss reorganization of their marketing organization. State Market Director Maddox has been holding meetings in southern and central counties in furtherance of the plan.

A test case is being made by the state department of agriculture of the shipping by John Cieghorn of the Highland district of a car of frosted oranges showing "marked drying in more than 20 per cent of the exposed pulp in more than 15 per cent of fruit."

The Coast and General

Portland's Rose Festival will be held June 7-9.

Homemakers' Conference, Oregon Agricultural College, Corvallis, March 20-26.

Arizona will hold its state fair this year. October 30-November 3 are the dates.

The next annual meeting of the National Grange will be held in Wichita, Kansas.

Onion growers of Cochise County, Arizona, are organizing a marketing association.

The Arizona Cattle Growers Association held its annual convention at Globe, February 23 and 24.

Farmers of the Pecos Valley of New Mexico have agreed with the Roswell gin to plant 3,000 acres of cotton.

Acreage planted this year to cantaloupes in the Salt River Valley of Arizona will be the largest ever grown there.

County Agent Pickrell of Yavapai County, Arizona, is in Missouri making purchases of pure bred bulls for cattlemen in his county.

The senate has begun investigation to determine whether a monopoly exists among the dye and chemical makers and to probe activities of their lobbyists.

A new potato quarantine has been issued by the state of Washington against entry of potatoes from California. This to prevent introduction of potato eelworm.

J. E. Mundell, newly appointed county agent of Yuma County, Arizona, has been for a number of years in charge of a government dry farming project at Big Spring, Texas.

California leads in growers cooperative marketing and according to U. S. census 25,772 farms in California market crops cooperatively, selling 17.6 per cent of the cooperatively sold produce in the United States.

Sugar beet growers of the United States have arranged with Cuban sugar interests to limit exports to this country "to the extent considered essential to their interests by the American beet sugar interests."

The bureau of the census and the United States forestry service will cooperate in collecting statistics on lumber resources in Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, South Dakota, Utah, Washington and Wyoming.

The Whatcom County Dairy Association, Washington, recently made contract for delivery of 1500 tons of powdered milk from its Lynden plant to a New York firm. The deal represents more than \$200,000 and will take from six to eight months to complete.

C. J. Fawcett, director of wool marketing of the American Farm Bureau Federation, reports that practically all of the pooled wools in the various concentration points have been disposed of on a gradually rising market. Particularly is there shortage in the finer grades.

The Commonwealth Farmers' Association of Australia is fathering a plan for a world wheat pool formed by cooperating grain growers of Australia, Canada, the United States and Argentina. President Trethowan of the Australian association is planning a visit to London, Canada and the United States in March.

The State Dairy Cow Competition, 1920-1922

TWO years ago dairy farmers endorsed the plan of arranging for a dairy cow competition to be conducted by the division of animal husbandry of our college beginning in the fall of 1920. After a conference with a representative committee of dairymen and breeders we were able a few months later to announce the competition. This information was published in the form of a station circular which was distributed during the summer of 1920 to dairy farmers and breeders in all parts of the state. Wide publicity was also given to the competition through the agricultural and dairy papers and the press generally. In the objects sought and in general scope and plan the new competition closely resembled the one conducted by the college during 1916-18, the story of which is told in Bulletin 301. We took advantage of the experience gained in that competition and further emphasized the importance of production records by grade and common dairy cows or herds, through more liberal prizes and a larger proportion of these for groups of cows and single cows in such herds. The educational value of a competition of this kind to the rank and file of our dairy farmers is readily seen. They are, as a general rule, behind breeders of pure bred stock in their methods of dairying and relatively few appreciate the vast difference in the capacity of different cows for dairy production or the possibility for increasing production and returns from a dairy that may be reached through adoption of modern methods of feeding and management.

Only about two and a half per cent of the dairy cattle in this and most other states in the union are pure bred registered stock; all the others are just common or scrub cattle of un-

From Address by Prof. F. W. Woll in Awarding Prizes

known or mixed breeding. Both because of their large number and the way in which they are frequently fed and handled anything that can be done to impress on their owners the possibilities of the modern dairy cow will in the aggregate lead to a marked advancement of the dairy industry of the state. Hence in this competition more than in any previous similar undertaking special efforts were made to interest owners of common herds through large and numerous prizes for high records of production. In this we were fortunate in securing the hearty cooperation of the officers and testers of cow testing associations in all parts of the state.

During late years the number of cow testing associations in California has gradually increased until now there are more than 20 of these in active operation. While these associations appeal mainly to the more progressive dairymen they are powerful agencies for improved dairying in the various communities where directed by a live association tester backed by interested public spirited officers of the association. The amount of good that an association tester can do who has the confidence of the farmers is not half appreciated by most people, but it is a fact that the right kind of a man in this position can have more influence toward changing methods and improving dairy herds in his territory than many a college professor or outside speaker whom the practical man too often adjudges theoretical and visionary.

In our efforts to get close to the cow testing association work of the state in connection with the new competition we were very successful in the

case of two of our most important dairy counties, Los Angeles and Humboldt, and also in the case of others more or less success was scored. Reviewing the results of the competition that comes to a close tonight, it seems to us, however, that it may be fairly characterized as a seesaw between dairymen located in these two counties, as you will soon realize later on. While 21 different counties in all were represented among the owners of cows and herds enrolled in the competition, the only two counties other than Los Angeles and Humboldt that had more than a couple of dozen cows to their credit were Stanislaus and Yolo; on the other hand there were 234 cows entered from Los Angeles County and 183 cows from Humboldt. The cause of the liberal support from these two counties can be traced directly to the interest that the officers of the local cow testing associations and the association testers took in this competition from the beginning.

The competition commenced September 1, 1920, with an enrollment of less than 100 cows. Owing to a change in the personnel of the division and to my own absence on leave up to November 1, entries came in rather slowly at first and did not exceed 200 cows until in January, 1921, but from that time on there was a rapid increase in enrollment, and when the entries closed on April 1 last year it was found that over 1,300 cows had been entered in all. Of these, nearly 800 were entered in competition for monthly or ten month records of production and the balance for yearly cow testing association records, the latter all from Humboldt County. Our

four main dairy breeds and dairy Shorthorns were represented among the pure bred cows entered, the Holsteins leading in number, with Jerseys, Guernseys, Shorthorns and Ayrshires following in the order given. Among the grade or common cows Jersey blood predominated, with grade Holsteins, "common" or scrub cows, so called, and Guernsey, Shorthorn and Ayrshire grades following in the order given.

The cows were owned by 71 different men located in 21 widely scattered sections of the state from Del Norte and Humboldt in the north to San Diego and Imperial Counties in the south. The competition was, therefore, truly statewide, as intended.

Monthly reports were issued regularly during the progress of the competition as soon as the returns were in; these were sent to the participating dairymen and to others who had shown their interest in the work. The press was also supplied with regular monthly summaries of the results and gave these liberal space, both in the case of the agricultural and dairy papers of the state and the city and country newspapers. A keen interest in the results published was evidenced, more particularly as to the awards of the monthly prizes of \$25, or a silver trophy of equal value, offered by the California Cultivator. This prize, which was given for the highest average production of butter fat for five grade cows in a herd, was won seven times by the Los Angeles County dairymen and nine times by Humboldt County dairymen, and only once did it go outside these counties, viz., to San Joaquin County, in September, 1920. These 17 prize winning groups of grades averaged 1,440 pounds milk and 67.65 pounds butter

(Continued on Page 272)

The Association and Bean Marketing

THE fourth meeting of the California Bean Growers' Association was held in San Francisco on Saturday, February 18, with a representative attendance from all sections of the state. President J. V. Mendenhall, in his annual address said in part:

The fourth year of the association just ended has been a momentous one. It has been a year of readjusting and reorganizing of its internal affairs, as well as of adjusting itself to meet post-war conditions.

The abnormal conditions which have existed from the very day the association was organized, up to the present time, have certainly not made it easy for it to function as it should nor to bring results which ordinarily would have rewarded our efforts. However, it is not necessary to dwell on the past history of the association, as it is well known to all. Business and financial conditions are improving, and the only way to success is to keep on.

The association is now on a sound business and financial basis. It is ready to proceed with the constructive work which has always been in view—to make bean growing in California profitable by stabilizing the market, through the wise control of the crop, to secure and hold the bean trade by giving it a standardized product, and to market the crop in an orderly manner, thereby guaranteeing to the producer that he will receive the average price at the average cost of doing business for the year.

New Bean Crop Agreement

Several months were occupied in preparing the present crop agreement and formulating amendments to the by-laws to meet its new conditions. Crop agreements and by-laws of many cooperative marketing associations in this and other states were consulted, as well as the best legal and financial authorities. The result is the present crop agreement which, it is believed, meets all requirements, and at the same time works no hardship on any member who has the cooperative

spirit and desires to live up to his obligations.

Association Extends Its Scope

During the past year the association has extended the scope of its operations to those counties south of the Santa Maria-Lompoc district, and now includes what is known as the Los Angeles district, comprising the bean growing section of Los Angeles, San Bernardino, Orange and San Diego counties. A large majority of the growers of beans, "other than Limas," were signed up in the counties mentioned. This membership campaign will be continued during the present year and the indications are that before the 1922 crop is harvested, fully 90 per cent of the growers will have become members of the association.

Warehousing and Processing

The success of every cooperative association in California is based primarily upon the fact that the product it handles has been standardized and advertised, until today California grown products are known all over the civilized world and have the preference of the consumer over similar products grown in the other sections of the country—except beans.

Beans are one of the few crops of the state that have neither been standardized nor properly advertised. Realizing the absolute necessity of standardizing California beans and the fact that this can only be accomplished by having complete supervision of the crop from the time it is harvested until it goes into the hands of the trade, the management has been authorized by the directors to prepare plans and recommend a site for the erection of its own processing and warehousing plants. This work is now going forward, and a report will shortly be ready for the members.

Advertising California Beans

The question of advertising our product under its own trade-mark must also receive our attention. In a recent address before a business organization in San Francisco the representative of one of the largest advertising mediums in the country said:

"Recent plantings in all parts of the state show that California crops are going to be larger in the future than in the past. It means that people of this and other countries will have to be induced to eat more of these products. The best way to induce them to do this is to tell of their goodness, and the cheapest way is to advertise. The task of selling these crops is not going to be an impossible one, for the reason that all are good, and the people of this country can be induced to increase consumption of them if they are told in an attractive and intelligent way of their goodness. The consuming power of the country is enormous. It is far beyond the belief of most people, as clearly shown in comparatively recent consumption of oranges, raisins, prunes, walnuts and other California crops. A very slight increase per person will result in a large increase for the crop.

"Success of the advertising efforts for all California crops is of vital concern to all the people of the state. Successful marketing of these crops is reflected in every quarter of the state. Each day's work that is provided by large industries, whether it be in a vineyard, field or orchard, in a packing house, office or on transportation lines, is one more nail in the prosperity of California."

Areas of Distribution Enlarged

The association is gradually enlarging its avenues of trade, both domestic and foreign. Eastern connections in the selling centers are being added to from time to time and recently a remunerative market has been established in Cuba and other West Indies islands. During the past six months we have shipped to Cuba alone about \$60,000 worth of beans, principally Large Whites, Pinks and Mexican Reds, and the indications are that this particular market will continue to serve as a profitable outlet for a large tonnage of those varieties.

Adverse Propaganda

The past 12 months have been difficult ones for cooperative associations from the point of adverse propaganda which has been and still is being

spread by those interests which are inimical to any organization which has for its object the more economical marketing of the products of the soil and the securing for the producer of a fair profit in return for his investment and labor.

As an instance of just what is being done in this direction the following is quoted from a recent press dispatch dated Washington, D. C., where a senate committee has been investigating the activities of the National Grain Dealers' Association, which was formed last year for the alleged purpose of combating the United Grain Growers', Inc. The secretary of the grain dealers is quoted as having admitted at this investigation that it had spent during six months of last year \$72,757 in combating the farmers' cooperative movement. He is also said to have criticized the secretary of agriculture for what he termed his failure to "check the pernicious political activity of farm bureau county agents."

The Weevil Menace

There is one important matter which seriously requires the attention, not only of our members, but of every bean grower in the state, one that is a growing menace to the industry. It is the alarming increase of weevil in certain sections. Reports from those sections which heretofore had shown but slight damage by the weevil, last season indicated that a greater amount of beans were affected, while known infested sections showed a rapidly increasing development.

Weevil can be quickly and effectually stamped out if growers will give more attention to the planting of certified seed, better cultural methods and closer attention to the handling and storage of the crop in warehouses known to be free from the pest. This is another vital reason why the association should handle the crop after harvest, as investigation has definitely and conclusively shown that many fields have been infected through migration of the weevil from the cleaners and warehouses, as well as the crops being infested in storage.

KIRKMAN NURSERIES

This Orchard Yields an Average Income of Six
Hundred Dollars per Acre

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

OUR EXPERIENCE

has been gained through thirty-two years of progression in the nursery and orchard business in California.

WE OFFER OUR SERVICES

in undertaking the planting and care of commercial orchards for prospective owners desiring a profitable orchard or vineyard without undertaking the improvement work. We will furnish the land and bring it into bearing under the guarantee that it will be PROFITABLE, or ALL MONEY invested will be returned to the customer with interest. The payments made by customers constitute a first lien on each subdivision tract. If every property becomes highly profitable as we plan all customers will take deed. If for any reason some of them should prove to be only fairly remunerative the customer has not taken a greater hazard than to make a safe real estate loan.

We have been growing orchards for others in conjunction with our nursery business for several years. ALL of these have been profitable to our customers. We are now in a position to serve those interested in high class income properties to the best advantage. Lands already secured for this purpose are situated at strategic locations on or very near paved highways and the very best of soils that can be secured regardless of cost. We now have growing or in the course of improvement a total of sixteen hundred acres, including considerable plantings of Thompson Seedless, Malaga, Emperor and Muscat Vines, also canning and drying peaches, apricots, plums, prunes and figs, including one of the finest young Kadota orchards in the state. These plantings are in Kern, Tulare, Madera, Contra Costa and Merced Counties, adjacent to thriving towns, modern schools, etc. We are willing to put our money in with our customer's and safeguard him against any possibility of a loss. Our part of the investment and our profit comes out of the crops of the properties. Details and location of properties on application.

TREES AND VINES

for everybody. Send for our descriptive price catalog.

Rudiment of Citrus Fertilization

By E. L. Koethen

THE most important element of plant food is nitrogen; it is also the most expensive. There is no other chemical element that compares in importance to the horticulturalist with nitrogen. The air we breathe is made up of 79.02 per cent nitrogen, and yet the plant that grows in it cannot take it into its system except in very small quantities without the aid of outside agencies. It is also the element most likely to become exhausted in our soils as nature is continually on the job of reducing it to the original state in the atmosphere. It is also likely to be found in your soil in a water soluble condition subject to wastage through rain and irrigation run-off. It is the part of good orchard practice to prevent these drains upon the nitrogen supplies in the soil.

The sources of nitrogen for plant use are organic or inorganic, that is, from vegetable and animal matter or from chemicals. As the Japanese who was buying fertilizers classified them—pointing to the nitrate of soda he said "Too muchy medicine." He meant he wanted his fertilizer to be derived from organic sources. He knew the difference between a chemical agent which was quickly available, but also quickly dissipated, and one which is in a natural organic form and becomes available as it becomes decomposed. The organic almost always costs more on the market than the inorganic and is worth more because there is a limited supply and we must have it. The production of inorganic fertilizers is only limited by the size of the production plants and the power available to run them.

The organic materials at our command can be divided into two classes; commercial or sacked goods and raw materials such as manures, straw, etc.

Of the former class blood runs from 12 to 14.5 per cent nitrogen and contains little of other fertilizing elements. Tankage, being a product of the slaughter house also, contains nitrogen from 4 to 10 per cent and phosphoric acid from 2 to 20 per cent, the proportion depending upon the proportion of blood or meat and bone contained in the material from which it is made. The higher the nitrogen content the lower the phosphoric acid will be and, again, the higher the phosphoric acid content, the lower the nitrogen must be. If the proportion is much out of ratio the buyer may be sure there is some reason to be found

in doctoring it with inorganic matter. The purchaser of fertilizers should be sure that there is no substitution for organic matter in order to fortify a low grade material.

The special office of nitrogen in plant feeding is to encourage growth of wood, leaf and fruit. A tree starved for lack of nitrogen will have small leaves, light green or yellow in color, and the wood growth will be short and thin. Of course plant growth needs all the elements, but this is the special office of this element.

Next in importance as a plant food is phosphoric acid. As shown above, it is found in variable quantities in tankage, bone, and manures. It is also found in certain manufactured products. Superphosphate is usually made by treating phosphate rock with sulphuric acid in proper proportion. The product is what is called an available phosphate. This question of availability is a mooted one. It is true that it is water soluble when placed on the land, but there are those who tell us that it reverts as soon as it comes in contact with the lime in the soil. The area of penetration after being applied is said by these to be but a few inches.

The third essential element that is liable to be deficient in our soils is potash. The state chemists tell us that most of our soils are supplied with enough of this element to last for many years. In such case the way to make it available is to give the soil an abundant supply of humus, and the problem is solved. We are convinced that in most cases where the application of potash has benefited orange orchards it would be found that there was a lack of humus and the available potash applied acted where the natural supply was locked up. In the application of potash salts only the sulphate of potash should be used as the lower grades are in association with chlorine compounds that are not good for citrus trees.

The fourth element that is likely to be deficient is lime. We have rested assured for years on the statement that our soils are most of them well supplied with this element. But now we are awakening to the realization that we were mistaken, for so many applications have been made on various orchard soils with beneficial results that we can no longer disguise the fact that many of our soils are deficient in lime and that it is beneficial to supply it in many instances.

March in the Vegetable Garden in Southern Arizona

By M. E. Bemis

MARCH for the ambitious Arizona gardener is quite possibly the most important, if not the busiest, month of the year. A greater variety of things may be planted, and it is the month for planting some of the most important things. The list begins alphabetically with asparagus, and incidentally there are some that believe that asparagus also leads in order of importance as a commercial crop.

This crop ripens early here and always brings good prices. It is of especially fine quality, and trial shipments to eastern markets have proved that there is a possibility of making it a great commercial asset. In returns per acre the reports of the Salt River Valley Water Users' Association show that it is first. Palmetto is the one variety that is recommended for this section. Seed may be sown this month, either in beds broadcast or in rows a foot apart. When rooted, which will be at one year old, it should be transplanted. Some prefer the two year old plants. Rooted plants should be put out in rows three to four feet apart and a foot apart in the row. Roots should be planted not less than six inches deep.

The spring crop of beans may be planted in March. Of bush varieties the Improved Stringless green pod; Black wax and Improved Golden Wax are especial favorites. Burpee's Bush

Lima and the Large Pole Lima are the favorites of the Lima varieties. Kentucky Wonder, Kentucky Wonder Wax and Broad Windsor are best for the pole varieties.

Beets, carrots, lettuce, mustard, early peas, onion sets, radishes and spinach as mentioned in previous articles are still in order for March. Cucumbers may be planted in March. Plant in hills four feet apart each way 8 to 10 seeds in a hill. Cucumbers are sometimes ready for the table six weeks from planting. Klondike, Improved Long Green, Boston Pickling, Arizona Davis Perfect, Early White Spine, Improved Long Green, Lemon and Japanese Climbing are all recommended varieties for Southern Arizona. Citrons are little grown, although they have a place in adding to the variety of preserves. For those who wish to raise them March is a good month to plant. The Preserving citron is the variety for making preserves and the green seeded variety is for stock.

March is the month for melons, especially watermelons. For the very early market many plant in February, covering the plants to protect from frost. The main crop of cantaloupes it is desirable to have ripen early in July, hence the main crop is not planted so early. For the home garden or for local trade plant now. There are many excellent kinds of both water-

melons and cantaloupes. The Klondike is an old favorite, with the Tom Watson a close second. Kleckley Sweet has many admirers and the Chilian melons, both white and black seeded, are popular on the market, although probably not yielding quite as heavily as some others. A new variety was brought to the Phoenix market last year by a grower at Mesa, which was of extraordinary size and splendid flavor. This was from seed brought from Texas from a variety bred up by the originator and which had been further improved by selection in the Salt River Valley. Of cantaloupes the Rocky Ford, Improved Eden Gem and other Gem varieties, as well as several others, are grown successfully and make good shippers. The acreage of cantaloupes in the Salt River Valley this season will be the largest ever grown. Honey Dew melons are being grown more extensively each season. They are splendid shippers and following as they do the cantaloupe crop usually bring good prices.

Pumpkins are in order for March planting. Probably they will never become a commercially important crop but for the home garden should be planted more extensively. Almost all varieties grown anywhere do well here and may be planted either as a spring or fall crop.

Squash should also be planted in March. Squash is easily grown, a general favorite on the local markets, and may have some commercial possibilities for nearby markets. Either the Bush Scalloped or Summer Crook-neck for summer squashes are splendid. Winter varieties such as the Hubbard mature in July and August if planted now and bring good prices on the markets. All squash are easily raised.

Parsnips and salsify should be planted in March. There is only one best variety of each, the Hollow Crown parsnip and Mammoth Sandwich Island salsify.

Tomatoes may be planted as seed in the place where they are to grow or be set out from plants that have been raised in covered beds. Probably the plant method is best. The Phoenix Special, Chalk's Early Jewel, Dwarf Stone and several other varieties are all good.

Peanuts are not grown as extensively as they should be. Some difficulty has been experienced in getting always a satisfactory germination and consequently a good stand, but there are still, in spite of handicaps, many who believe that peanuts are one of our most popular crops, and for the home garden certainly there is a place for peanuts.

THE EVAPORATOR CONFERENCE

By Norman Lombard

Conferences seem to be the order of the day, and if they are effective in clearing up international difficulties they should be equally desirable in business and everyday affairs. Accordingly several hundred growers, financial people, university professors, officials of cooperative associations and representatives of evaporator manufacturers and contractor-builders of evaporators were asked to meet on February 18. The conference assembled at San Francisco, traveled through the Santa Clara Valley and ended its tour at the Hotel Vendome in San Jose, where a banquet was spread.

Several different types of evaporators were examined on the tour and their owners interviewed. Growers from various parts of California who were present had thus a splendid opportunity to study the whole subject of evaporation without fear of undue influence by salesmen or enthusiasts for any particular type or make, and it is conservative to state that numerous converts to evaporation were made on the tour itself, especially when it was realized that the standard field trays can now be used in the modern evaporator.

Professor Christie, evaporator expert of the college of agriculture explained that he was conducting an investigation into the cost of sun drying and had already gone far enough in the work to demonstrate that evaporation was cheaper than sun drying, all factors considered. He explained that the cost of the evaporator would be just about offset by the value of the dry yard, which is frequently the

best land a grower owns and should be producing fruit. The aggregate acreage lying idle in dry yards is now tremendous and should be reduced. He stated that labor, materials and all factors in both methods of drying had been calculated from figures furnished by growers and he pronounced evaporation cheaper than sun drying only after mature deliberation. Of course in some years sun drying is impossible at any cost. The cost is increased by the necessity of stacking, some years more than others, to say nothing of damage caused by rains and heavy dews.

As to quality and weight of the two products, evaporated and sun dried, he cited that of the whole lot of evaporated prunes delivered to the association last year (a perfect sun drying year), 94 per cent had been given the highest quality rating, a remarkable statement, since these "evaporated prunes" included rain damaged fruit which had been rushed through evaporators to save it, and this rain damaged fruit should really not be considered in the class of fruit dried

entirely in evaporators. He stated that evaporated fruit was heavier (less shrinkage in drying), sweeter (because no sugar was lost in fermentation), more pliable and attractive to consumers, had better keeping qualities (because it does not sugar up after packing), and that it was generally free from streaks and air pockets and the golden pit, typical of the best evaporated product, was proof conclusive that the prunes had not fermented either during drying or afterwards. From a sanitary point of view: No objectionable foreign matter can contaminate the fruit cured in an evaporator. Also evaporated fruit lends itself better than the sun dried article to packing in small cartons, which is the method of packing preferred by consumers.

He predicts a great increase in the use of evaporators now that the long period of experimentation and "wild catting" had passed and the really efficient types of evaporators had proven themselves in actual practice.

Several growers presented facts

showing their satisfaction with the results of their experiences with evaporators.

FARM BUREAU MEETINGS IN TEHAMA COUNTY

Regular monthly meetings of the centers of the Tehama County farm bureau: Oak Park, March 10; Johnston-Reeds Creek, 13; Red Bank, 15; Bend, 17; El Camino, 20; Stanford, 22; Liberal, 23; Flourney, 24; Bowman, 25; Richfield, 27; directors, Red Bluff, 25.

Farm home department meetings: Antelope, March 14; Richfield-El Camino, 15; Dairyville, 16; Bend, 17; Oak Park, 20; Vina, 21; Squaw Hill, 22; Flourney, 23; Red Bank, 24; Red Bluff (county meeting), 25; Bowman, 28; Corning, 29; Henleyville, 30.

"What! Chollie? He works just about as hard as a sundial does on a rainy day."—Boston Transcript.

Willard Standards of Service Are Your Protection

Every Willard Battery Station is conducted according to definite Standards of Service. These are as follows:

- 1 To render our very best service with equal interest and skill to all motorists and on all makes of batteries without reservation or distinction.
- 2 To maintain such location, equipment, and personnel facilities as will permit each station to offer a complete inspection and advisory, filling, repair, rental and replacement service, in keeping with the needs of the locality in which it is established.
- 3 To maintain repairmen of broad experience, judgment, and mechanical and electrical ability, upon whom owners of all makes of batteries can depend for accurate reports and sound advice as to the condition of their batteries, as well as expert repair service when needed.
- 4 To remember that good-will is the most precious of commercial assets to each one of us; and that the battery owner who comes in for testing and water is as welcome and as fully entitled to prompt, cheerful, expert service as the owner who is in need of work that creates revenue.
- 5 To manifest at all times, and to all visitors and customers, the same courtesy, interest, helpfulness, and good-will that we would like to receive if the position were reversed.

March in the Ornamental Garden

Southern California

By Ernest Branton

WING to the absence of hot weather nearly all gardening operations suggested for February may be carried on during March. At this season gardeners propagate hard wooded trees and shrubs with considerable success, even such ornamentals as gingko (malden-hair tree), mulberry and sycamore, also the shrubby flowering quinces. Figs, grapes and olives also root well now. Bridal wreaths (spirea) and many other deciduous flowering shrubs will also root from cuttings, but as gardeners want to make sure, and not spend too much time, they generally layer, that is, cut half way through a low branch, push this part down to or into the soil and cover until rooted, either pegging, down with a wire like a

large hairpin or keeping in place by plenty of soil on top. Plants for such treatment are carissa deutzia, fuchsia, feijoa, forsythia, crepe myrtle, lemon verbena, honeysuckle, magnolia, wiggelia and wistaria.

In making cuttings pruning shears will not do unless cuttings are later trimmed at both ends with a very sharp knife. Cuttings may be six or more inches long, put in soil with one bud above surface and the second one just at surface. Do not push them into soil, but either make a trench or first thrust down a stick larger in diameter than the cutting. To push them down in stiff or harsh soil, bruising the ends, is to invite failure. It is well to note a warning that while cuttings may be taken, present pruning of some of these shrubs will cut away the spring crop of flowers. Prune these immediately after flowering. Altheas, fuchsias and hydran-

geas may be pruned now as they flower much later in the season and on new growth.

It is still not too late to sow seeds of native wild flowers. Get a good sized package of mixed California natives and sow broadcast, giving plenty of water. It is also a good time for broadcasting all flowering annuals. If sown too thickly do not be afraid to thin well, taking out the weaker plants. Unless well thinned the plants will not develop and the flowers will be few and inferior. As a rule seeds sown two months ago have made little progress because of lack of sunshine and heat. For this reason the last sowing of sweet peas may be made; also alyssum, calendula and larkspur. With a touch of hot weather garden sowings (outside seed beds) may be made of ageratum, begonia, coleus, heliotrope, periwinkle and verbena. Many bulbs may still be planted with assurance of fine flower crops, and no better time than now could be chosen for fertilizing or renovating lawns.

Propagation by division of nearly all perennial roots is best done just as they start spring growth or generally during March. Delphinium or larkspur, goldenrod, golden glow, perennial sunflowers and phlox, penstemon and Shasta daisy are a few of the more common of this type. Clumps of chrysanthemums may now be disturbed or stimulated to get cuttings for the coming autumn's flower crop. A prize winning grower takes his cuttings about the middle of March but has fine flowers from cuttings rooted throughout the month of April. Growers of good 'mums root cuttings each year and then throw clumps away, though these latter may be divided and produce fine flowers for house use. During the latter part of March one may plant and divide calla, canna, dahlia, tigridia, tuberosa, plant out the last of gladiolus and other bulbs.

Northern California

By A. R. Gould

WE are getting now into early spring, which means that there should be great activity in the garden. The soil will now respond and seeds will germinate much more quickly. The next few weeks should see everyone busy transplanting as the conditions will be very favorable.

Roses may be planted now and also pruned back. Shade trees, conifers, shrubs, may be planted now, but do not lose sight of the fact that when planting, no matter how small the plant, it should be placed correctly in the position best suited to it and the soil should be well prepared. The hole should be dug large enough and proper space given for root development, as this will mean much to your success in garden development. Correct grouping and arrangement are other important details. In purchasing your trees and shrubs select only the best stock, as it is better to pay a little more and have the right quality than to get cheap weak material that will cause disappointment after time and trouble have been wasted. The best is always the cheapest in the end even in plants.

The slugs just now are getting very busy, and perennial plants in the borders should be thoroughly gone over to destroy them.

Seeds to Sow

Godetia, scabiosa, balsam, petunia, centaurea, cosmos, larkspur, celosia, schizanthus, nemesia, chrysanthemum, dianthus, linaria, clarkia, marigold (African and French), verbena and blue daisy. All these may be sown on a warm border and will transplant easily and give a wealth of bloom.

Early Flowering Sweet Peas

These will now require a stimulant, and liquid manure is ideal. Water three times a week if you wish to have choice blooms and they will keep blooming much longer.

The Water Garden

Water iris thrive in the pool, and the yellow and blue varieties are very pretty, also water poppy, a charming yellow aquatic, and parrot weed, which quickly spreads and has delicate foliage. Then there are a great number of varieties of water lilies, some hardy, some night blooming and some tender.

Climbers

The best climbers for a quick effect are cobeia scandens, Tecoma Australis, mattress vine, passiflora and wild grape, and, of course, some of the stronger growing climbing roses. If you need something very choice as a climber the wistarias are hard to beat. Bignonia cherere is also a pleasing shade and the white and yellow jasmine is fragrant. All these should be given consideration.

Stocks

These very popular flowers will give you bloom throughout most of the summer. They need a fairly rich soil and not too much water.

Southern Arizona

By M. E. Bemis

THOSE who are fortunate enough to be able to secure plants of asters for replanting, or were thoughtful enough to plant the seed of this old favorite in January, may plan in March to transplant into the open.

Now Ready!

Goodrich "55" CLINCHER FABRIC TIRE

The NEW 30×3½ for \$10.90

HERE is a real tire of real quality, at a price most remarkably low. It has everything that you demand — construction, appearance, long life, low price.

It's a GOODRICH — Great Value!

Made with all the skill of Goodrich, of high-grade quality throughout and perfected with its scientifically constructed, anti-skid tread of thick, tough, specially-compounded rubber.

Ask your dealer to show you this remarkable tire. Remember the name — Goodrich "55" — price \$10.90. Also made in 30 x 3 size.

If given proper attention asters will furnish a wealth of rich blossoms and in varieties of crimson, lavender, pink, white and mixed colors. They need rich soil, but fresh manure should not be used, only rotted manure or compost. Balsams are easily grown, and March is a good time to plant them. Transplanting several times is said to increase the tendency of the plants to produce double blossoms. Best results are obtained by giving them plenty of room and an abundance of water.

Among the plants that grow three feet or more in height and are suitable for the background of flower beds may be mentioned the feathered cockscomb, celosia or celosia plumosa. The flowers are crimson or yellow. The plumes are also ornamental and may be cut and dried for winter flowers. March is the month for planting. Cosmos is another plant that grows to a height of three feet or more and may be utilized for hiding fences or planted against evergreens. The plants should be thinned to 18 inches. Seed may be had in crimson, pink and mixed colors. Castor beans should also be planted in March. There are two varieties which do well in Southern Arizona. The large crimson flowering is much used to produce quick shade. Plants of this variety frequently grow to a height of 15 feet in a season, with branching limbs that furnish as much shade as a good sized tree. The smaller variety is more ornamental.

The helichrysum or strawflower, may be planted now. Rich soil is preferable and transplanting improves it. Four o'clock, larkspur, marigold, nasturtium, petunia, portulaca, sweet alyssum, verbena and zinnia are all old favorites that should have a place in the flower garden, and March is the month to plant them.

All vine seeds should be planted in March. Among these are the Australian pea vine, balloon vine, balsam apple, scarlet runner bean, cardinal climber, cypress vine, dolichos, or hyacinth bean, all kinds of gourds, kudzu vine, moonflower, morning glory and passion flower.

It is not too late for some of the bulbs such as dahlia, gladiolus, Madeira vine, tuberose, canna and caladium. Rose bushes are better set earlier but may still be put out with good success.

Sunflowers are grown for poultry feed, for silage and for shade, but in spite of the usefulness of this plant it is appropriate to include it among the flowering plants that should be planted in March.

STRAIGHTENING WIND BLOWN TREES

I notice frequently accounts in your columns and elsewhere of orchardists' troubles in straightening up wind blown trees. I have used a method for many years with unvarying success, adapted from the Wisconsin raftsmen in handling floating lumber, then known as "the Spanish windlass." The equipment necessary is very simple and inexpensive and results positive.

For ordinary trees, as peaches, apricots, etc., from six to ten inches, one requires a length of 1½ inch pipe, six feet or so long, a crowbar or piece of two by four scantling for a lever, and 25 to 30 feet of good inch rope, a smaller rope for lighter trees and a longer one for taller ones. If doing the work single handed two guy ropes from the top of the vertical pipe to near by trees are necessary. A rope like a clothes line is sufficient as the strain is not great, and a bit of cord to tie the lever to the rope while installing props. If with a helper the guys are unnecessary, as the pipe is easily kept upright by holding.

Method of using: Tie the rope well up on the tree to be raised, inserting a folded gunny sack if bark is tender. Stretch rope in direction tree is to be raised, make a loop hitch and insert crowbar or whatever may be used for a lever. At this point stand the pipe vertically, projected a few inches into the soil, start winding the rope on pipe by simply walking around pipe with the lever (use lever long enough to make the work easy). Trees should be pulled a little more than plumb, anticipating some back settling.

If a heavy pull is required and the soil is loose a block imbedded in the soil at the foot of the pipe will prevent dragging. If the tree is over so far the pull will be horizontal set two by

He beat the train to the crossing a good many times

"It's never touched me yet," he explained when they pointed out the risks.

That's the answer a good many people make when they hear that the drug element in tea and coffee often harms nerves and health. They say it's never touched them yet.

Sometimes they only *think* it hasn't.

Wakeful nights, drowsy days, headaches that keep coming more frequently—often are blamed on bad luck when the blame belongs on bad judgment in taking needless chances with harm.

Over on the safe side is Postum, a pure cereal beverage, delicious and satisfying—containing nothing that can harm nerves or digestion. Thousands who used to try their luck with tea or coffee are enthusiastic over having found safety and satisfaction in Postum.

It's worth your while to make the test with Postum for ten days. Postum is a delightful drink for any member of the family, at any meal.

Your grocer has both forms of Postum: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes.

Postum for Health "There's a Reason"

Made by Postum Cereal Company, Inc., Battle Creek, Mich.

Motor Troubles Ended

New Invention Creates Wonderful Spark—
Doubles Power, Makes Winter Starting
Easy, Stops Oil Pumping, Eliminates
Carbon, Saves Gas—Free
Trial Offer.

Any car owner who is bothered with a motor which pumps oil, fouls spark plugs, wastes gas or carbonizes badly can stop these troubles by using a remarkable device called Warren Transformers, perfected by W. H. Warren, a Kansas City motor expert.

In two minutes a boy can attach Warren Transformers. Then you will be amazed to see your car go whizzing up hill on high where you formerly had to shift gears.

You will also notice a big increase in your mileage and instant starting in coldest weather. Spark plugs that formerly fouled and cylinders that pumped oil will be clean and dry and fire with full power.

If you want to save 25 to 50 per cent on fuel and repair bills, be rid of misfiring cylinders, dirty plugs and carbon, have a quick start in coldest weather and pep on hills, write the Warren Mfg. Co., 203 Gray Bldg., Kansas City, Mo., and a set of Warren Transformers will be sent immediately, with the understanding that they do not cost you a cent if not entirely satisfactory.

So confident is the Warren Mfg. Co. that Warren Transformers will more than delight you that they offer to send a \$4 set for only \$2. This is a special introductory offer, good only a few days, and readers should take advantage of it immediately.

Send No Money with your order—just your name and address. Name of car and number of cylinders. Warren Transformers will be sent immediately. When they arrive merely pay the postman \$2 and postage. Use them 10 days. If not satisfactory return and your money will be refunded. Write today. End your motor troubles. This offer fully guaranteed.

four under rope near tree to get an up pull for a starter.

Position of small buildings is easily shifted by this device.—Subscriber, Escalon.

COOPERATIVE CANNERIES

At the recent annual meeting of the trustees of the California Cooperative Canneries Albert Haentze was elected president. Mr. Haentze has been active in the work of the association, having served for the past two years as secretary and treasurer. From the report of the meeting made by the San Jose Mercury we quote:

The annual meeting of the trustees of the California Cooperative Canneries, held recently in San Francisco, resulted in the re-election of the same board of directors which has conducted the affairs of the big growers' canning concern during the past year. This board is made up of Messrs. Albert Haentze and S. E. Johnson of San Jose, Frank L. Blain of Visalia, M. S. Amerine of Modesto, and Vernon Campbell, the general manager of the organization. A vacancy existing in the board of trustees, created by the retirement of Frazier O. Reed of this city, was filled by the election of Frank P. McCray, who is one of the prominent growers of the Sunnyvale district and a prominent civil engineer.

A change in the executive management of the canneries was made necessary by the retirement of S. E. Johnson from the presidency of the corporation. Mr. Johnson has served

in this capacity for the past three years and retires from office much to the regret of his fellow associates. He will continue as chairman of the board of trustees.

The position of secretary and treasurer made vacant by Mr. Haentze's elevation to the presidency was filled by the election of D. C. Moore. Mr. Moore has been auditor of the company for some time and is thoroughly equipped by broad business exper-

ience for the position he now holds.

Vernon Campbell continues in the capacity of vice-president and general manager. Mr. Campbell has pioneered the way for cooperation in the canning industry. For the past year he has been fighting in Washington for the modification of the packers' consent decree which deprived the cooperative canneries of their largest market.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Plants Named.

Am sending two specimens for identification, one a flowering shrub, the other the fruit from a small plant. Is the flowering shrub a species of boxwood and how do you start new plants from it? Is the other suitable for a potted plant? Is the fruit poisonous or good to eat?—Subscriber, Orange.

The flowering shrub is laurestine; *Viburnum Tinus*, of the botanist. It grows very easily from good sized hardwood cuttings taken at almost any time of the year. Lower branches may be pressed into the soil and a small portion covered, leaving tip exposed, and will readily root in a few weeks. They may be cut from parent and replanted. You may find some in this condition now on shrub. The fruit is evidently from the Jerusalem Cherry, *Solanum Pseudo-capsicum*, a splendid pot plant. The fruit is not edible.

Pruning Strawberries.

In recent issue of the Cultivator there was an article about strawberries in which you spoke of pruning properly. What do you consider the proper way to prune them so a bed will be in good shape for several years?—Subscriber, Orange.

The first year strawberries need no pruning but afterward are pruned every year if necessary to keep from matting too thickly. Cut off runners so they will not be thrown on top of vines by cultivator passing down the rows. The work is done only when condition of plants demand it.

Top Working Apricots

If apricots are affected by brown rot this spring there will be lots of local grafting done. We want to know best method, kind of wax, best method of keeping scions. Can we graft after leaves on trees have started?—Subscriber, Hollister.

Cut scions now and keep in damp sawdust, moss, shavings or sand until needed, keeping always in cool dark place. Split stubs for cleft grafting are best. After leaves start many prefer bark grafting but this requires more care. Still later some resort to budding. For top working the Los Angeles County farm adviser uses a wax of one pound beeswax to three pounds resin. If weather is cold add more wax; if hot, resin. See article on top working in next issue.

Weak Stock

About a year ago I bought a buck and three does from same pens, but not related, all of mature age, and one doe had about six or eight young nursing. She raised them, and I think that they were the last that she ever raised to maturity. I had another doe that soon had a fine litter, and they also died when they were about half-grown. I raised two does from the first litter that I bought and bred them. They had small litters, but they all died when about half grown or less. I used the same buck for a long time, with the same result continually. Then I thought that perhaps the buck was weak, so I changed, getting a first-class mature but young buck, and the result is no better. They show no signs of sickness until one or two or perhaps three days before they die. Then they will droop around a short time and die. I feed dry alfalfa hay and barley; plenty of clean water. Hutches are larger and better than the majority of hutches, are kept fairly clean, and are located

under the shade of trees, where they get only the sun in the morning to about 10 o'clock. Usually it is not too warm, but occasionally it does get rather warm, and I have seen them panting, but I never saw any direct bad effects from that. I say that I house them under the trees. I do not mean by that that they are kept in a damp, shady place, but the trees are tall and the branches are high, so that there is plenty of air circulation for them. The adults are healthy and strong.—Subscriber, Camarillo.

The main cause is close inbreeding; the small litters and not raising young show this; would dispose of that stock. It may be that the hot sun prostrated, so that stock has not sufficient vitality to produce strong young. Would suggest putting one layer of bagging in front to break the fierce sun rays from 8 to 10, when direct sun is often too strong for your stock. Think it best to procure new foundation stock from other breeders and build up from them, selecting only good, strong, quick maturing young for breeding.—W. D. W.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Purchased on Contract

We purchased land on contract and sold a portion of it on contract. The party to whom we sold does not keep up his payments and recently sold his interest to a third party. Our original vendee has now disappeared. Would he have any right to sell, and what can be done to straighten the matter out?—Subscriber, Hynes.

Your vendee very probably had the right to make this sale of his interest but could not thereby relieve himself of the responsibility of the contract unless the assignment was accepted by you. About the only remedy is to bring action on the contract and have the judgment that the vendees are in default. Then you will be entitled to either a judgment for the purchase price or the return of the land.

Custody of Minor

Can a man who has been convicted of felony and who has otherwise a bad reputation obtain the custody of a minor child in divorce proceedings?—Subscriber, Englewood.

There is no positive rule in respect to the custody of children as it has been deemed best to leave the matter to the discretion of the court in each particular instance. It is generally the case with very young children for the court to give the custody to the mother in any event unless she is in some way unsuitable. It would probably be, in a case such as stated, that if the mother was unsuitable, the child would be placed in some home. It would be out of the ordinary for such husband to obtain the custody.

Fence on Line

A fence which is held in partnership is on a section line. One party deeds a strip along the fence for a public road. Can he legally take possession of his half of the fence and move it across the right of way?—Subscriber, Corcoran.

As the fence was placed on the line with the consent of both parties and both parties contributed thereto, undoubtedly no part of it could be removed from the line except with the consent of both parties. The deed

Night Work Now Safe on the Farm

DELTA No. 10 HAND LANTERN

Order Today 275

Unless the child has been legally adopted he does not become a legal heir of the foster parents, but they can will to him any property which they leave. It would seem that the gift by will would be far better than gift by deed, as that probably would entail difficulties during the lifetime of the foster parents.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Tuberculin Test

A cow of mine reacted to the tuberculin test. The state veterinarian later tested her and gave her a clean bill of health, she having failed to react in two previous tests. Should she have had a larger dose of the serum because of having reacted once?—Subscriber, Orland.

There are cases where a cow might react at the time of the first testing and in time become so far advanced with tuberculosis that there would be no reaction, but a competent man would not mistake a case of that kind. If the tests are applied too close together the later ones will not show much if any reaction and what appeared to be a reaction the first time might have been brought about by something else showing up just at that time. These remarks are directed toward extreme and peculiar cases. Generally the tuberculin test is reliable but occasionally things do not act just right and in those cases a competent man would consider general symptoms and render good judgment. If the amount of tuberculin generally used does not bring a reaction a larger amount would not. In the case you describe if the cow is in good health and has no cough you can dismiss all doubts that you may have in mind. The state veterinarian might make a mistake, but those mistakes are so few now and the tuberculin test is so well understood that they may not be considered.

NEW CREAMERY BUILDING AT UNIVERSITY FARM

Dairying is California's third largest agricultural industry. The value of dairy products in the state in 1920 was \$99,004,358. Of the 778,951 dairy cattle in the state 502,415 cows were required to produce the milk for these products.

Recognizing the place which California now holds in dairying and its prospect of permanence and future development, the legislature in 1917 appropriated funds for a new dairy industry building to be constructed at the university farm. The war delayed its construction and the increase in the cost of building materials made it unwise to make a start until more funds were available. The last legislature provided additional funds for buildings at the university farm and the regents have generously set aside a total of \$195,000 for the construction of the dairy industry building with additional funds for furnishings and equipment.

The building as a whole will be constructed of hollow tile with reinforced concrete frame. It will consist of a two-story main structure, 234 feet long, and a dairy manufacturing wing running back from one end of the main building about 100 feet.

The first floor of the main building will include laboratories for butter and market milk, commercial testing, student testing, farm dairy and bacteriology; a salesroom, offices and student locker room. The second floor will be occupied by three lecture rooms, seminar, reading and dairy products judging rooms, and office and storage space.

The manufacturing wing will house the large creamery laboratory which will be used for teaching advanced students and those electing practice work in butter, cheese, ice cream, market milk and milk condensing. There will also be the milk receiving department, a student cheese laboratory, refrigerating, ice making, storage and machinery rooms.

A distinctive feature of the new dairy building is the provision for several small units of equipment in each department, making it possible for

each student to work independently. The increased equipment will make it possible also for instructors to teach larger sections which will accommodate a larger number of students.

The construction of this building should have a marked influence upon the future development of dairying in California. Facilities will be available for giving a thorough course of instruction and for carrying on investigational work. These facilities should stimulate student interest in dairying and when they go out into the state on dairy farms or in dairy plants we know that they will carry with them the principles that are taught in the class room. They will set standards that others will follow. Eventually they will employ other students that come after them and gradually the whole industry will be raised. The dairy industry of this country is in great need of well trained men. The best source of them is found in the dairy departments of the various state agricultural colleges. The University of California now adds further support to the agriculture of the state by increasing the facilities for dairy teaching.

There should be a great revival in the planting of small fruits and grapes in connection with home gardens. The care of small fruits as regards spraying and other requirements is more

simple than that of the orchard fruits, and the small fruits can be grown on a much more limited space.

WE Solicit Your Order For Nursery Stock Because

—We have been in this business over 40 years in California.

—We propagate from our own bearing tested trees.

—We use great care in handling nursery stock.

Permit us to send you our new descriptive catalogue of Fruit Tree or Ornamental Nursery Stock.

SERVICE WITH A CONSCIENCE

Webster's Dictionary defines SERVICE as a duty done or required; performance of labor for another; office of devotion.

RAILSBACK SERVICE does not mean giving something for nothing, but it does mean just what Webster says it means.

The conscience of this firm requires it to perform its duty and its office of devotion to its customers in a way that promotes mutual benefit.

It is the policy of L. M. Railsback Company to carry only the best lines of implements and farm machinery—lines backed by quality and the integrity of firms with national reputation. To be ever alert to employ business practices which will enable the sale of implements to farmers, at the lowest possible price consistent with quality and performance. To accept no sale unless the purchaser is benefited and satisfied.

Constant effort is being put forth to establish systems of delivery which will save time and expense to its customers in securing necessary equipment. Field men are ready to serve our customers and to give them the benefit of expert advice in the selection and putting into operation of tools for any special purpose. Railsback Service does not end when the purchase is made. It stands back of the goods sold, and is a guarantee of satisfaction.

Note the list of lines we carry and write us for literature and prices.

L. M. Railsback Co.

SALVE, SEQUOIA!

Hail, Sequoia, giant of the trees,
Proud survivor of an ancient race!
In days and years I figure time,
Milleniums thou; thy century is my year.
Long generations of the lesser trees
That frame the forest's leafy aisles
Have come and gone since thou began,
A timid plantlet starting for the skies.

But now thy fluted shaft of cinnamon
shade,
Bearing aloft its crown of pendulous
sprays,
Stands unbending to the tempest's shock
Nor dreads the earthquake's ponderous
tread.
Wrapped in thy thick carapace of bark
Thou fearest not the lightning's flame;
Thou'st outlived the fury of ten thousand
storms.

Not of our day, a thing apart art thou—
Majestic, silent, enwrap perchance in
thoughts
Of ages gone, when Mother Earth was
young.
Emblem of age and immortality,
Tell me, I pray, where hides the spring
Whence thou hast drunk the elixir of life?
Teach me the secret of perennial youth.
—C. I. D. Moore.

STARLIGHT

(Continued from last week)

Chapter two in our calf feeding experiments came that evening when we tried to get one of our cows to adopt Starlight; for of course we could not think of allowing Polly to go on devoting her poor fingers to the cause of a calf's nourishment. We had put our faith in Belle, a large red cow of gentle disposition and irreproachable character. She had a calf two months old.

The moment Starlight set eyes upon her she gave a glad moo and frisked to her side. Belle's calf was on the other side, but Starlight had not noticed it. The cow lowered her head and butted Starlight across the corral.

Fortunately, our cattle are dehorned. Starlight picked herself up, swayed on her poor legs and looked with astonishment at the cow.

Belle threw her a glance of contempt and turned her back. Starlight seemed to regard the act as an invitation to supper, and with an answering moo ambled to the feast.

Belle turned, put down her big head, took Starlight between the legs and flung her in a heap.

Then we determined to try Blackie, and in order to make the proceeding perfectly safe we hitched her to a post. Starlight got three good swallows. Blackie bided her time until the calf was fairly established and was forgetting her late woes; then slap came a black tail on Starlight's ear, and smash came a hoof under Starlight's chin.

Starlight's head flew up, and before she could moo Blackie wheeled, took the calf on her heels and sent her sprawling across the shed.

Now, in our bunch of home cattle we had a venerable white cow that in her youth had given much fine milk and that bore the name of Daisy; but now we called her The Antique because she had come to the last act of usefulness in her long career; we were fattening her for beef.

The Antique was stolidly chewing her cud, but no sooner had Blackie sent Starlight flying than she gave Blackie a look that Polly described as "the most awful look ever seen on any human face," marched up and prodded the black cow's ribs. Then she went to Starlight, bent over her tenderly and began to lick her. Starlight wobbled to her feet. The Antique took the calf under her neck, resumed her cud and defied the world. Gently coaxing, she pushed Starlight to the side of the black cow and admonished her with a second punch in the ribs. Starlight hesitated for a moment and then had her supper.

Because of The Antique's noble act we were bound to keep her at least until she had raised Starlight for us. And to that task she now began to devote her declining years in a manner beautiful to see. She seemed to live only for the motherless calf. She saw to it that Blackie delivered the meals, and between whiles she licked the calf and showed her how to nibble grass.

Starlight proved to be a prankish youngster. One of her tricks was to run away and hide. The Antique would low and call the moment she missed her protegee, and Starlight enjoyed her distress like a naughty child. Many a time we saw her slyly watch-

ing from her retreat while The Antique pranced round in anxiety. At those times Blackie always got a poke in the ribs; The Antique seemed to be searching her to make sure she had not swallowed the calf.

Our ranch is fenced, but on the other side of the wires the range stretches away for miles and miles. Every day the range cattle come by in droves on their way to the springs.

Starlight presently discovered them and learned, as Polly said, that there were children of her own age to play with. Belle held her own child entirely aloof. She would not permit him to associate with a child whose parentage was unknown to the dwellers in the pasture.

But any well behaved child was good enough for the range cattle. The calves called Starlight to come along out and play and cuddled up to her quite as if her mother were not the best Jersey in our part of the state. Starlight crawled beneath the wires and joined the merry throng.

We always knew when she yielded to the temptation, because The Antique told us. Standing on the wrong side of the wires that she was too tall to go under and too stiff to go over, she bellowed out her opinion of range cattle and her desire to have her little Starlight at home.

Then Polly would call, "Starlight—Starli-light!" and Starlight would come prancing. For when Polly called, Starlight always obeyed.

The calf grew sleek and fat and foolhardy. Her free and easy manner of straying about on the range soon began to give us some concern, for the bounty on wolves and coyotes had been taken off, and the creatures were multiplying with alarming rapidity. As cold weather approached they came more boldly to the house and the corrals. Range calves were well grown by October and pretty wild; ranch cattle were inexperienced.

The cows seemed to know that danger was abroad and bunched together as they grazed. But Starlight paid no heed to warnings. What we supposed happened was this: Starlight played one of her hide-and-seek tricks in the bushes, and while her attention was on the old cow's distressful hunt a wolf trailed her and sprang, but failed to pull her down. That is the only way we can account for the long bleeding gash on her flank.

The first we actually knew of the attack was a tremendous bellowing. My sister and I heard it, but we were so well used to The Antique's howling that we paid little attention. It was Polly, who was playing outside, that went to find out what was the matter.

She climbed the ridge that overlooks the meadow and raced back, screaming at the top of her lungs, "Mamma! The wolves are eating up our cows!"

My sister and I were alone. Jim was fencing a distant pasture. My sister snatched up the shotgun and I the rifle, and we followed Polly.

There were some sixty head of stock in the pasture, full grown two year olds, yearlings and perhaps twenty calves. The grown cattle, all cows, had placed the calves in the center and were milling. Round and round they went, like a huge wheel, stamping, snorting, bellowing, and every minute or so charging a wolf. Outside the circle were five wolves, charging the cattle in flying leaps.

Our dehorned cattle had no chance against them. A cow would charge and butt a wolf and sometimes roll it over, but in five seconds it would be up and at another cow.

In all the wild scrimmage of milling cows and jumping wolves we perceived a leader. The Antique pranced round and, snorting defiance, urged her valiant band to victory or death.

We stood on the ridge and tried to decide what to do. Finally, we left Polly and with our guns descended into the lower field.

It is an indescribable sound, the trampling of hundreds of hoofs. It is frightening. At any moment the mill may break, and the stampede rush over you.

My sister and I advanced cautiously through the field until we were within easy shooting distance, but we saw no way of shooting without injuring our cattle. Step by step we moved up

and watched our chance to pick a wolf off the outer edge of the circle.

Every few seconds a blotch of white came into view and then disappeared on the other side of the mill. The white cow was now running free of the herd and bunching them in a tight ring; the rest ran noses to tails. All the two year olds were milling with the cows, but the calves stood still inside, bawling now and then as they thrust their noses into the air and scented the wolves.

Two of the wolves were harrying the white cow, one snapping at her nose, and its mate watching to make a flank attack and ham-string her. The other wolves were idly keeping the mill in motion and waiting for the leader to fall. None of the animals seemed aware of our approach. My sister motioned me to follow, and we tiptoed to one side. Once, twice, thrice the white cow and her pursuers faced us head-on and whirled away. We saw that the forward wolf was running on the outermost track of the great heaving circle.

My sister stood with the gun poised. Four times! The white cow dashed out from the rear. Bang!

It was the prettiest shot I think I ever saw. It bowled the leading wolf completely over just as the white cow swept past us. Some of the shot reached its companion.

The wolf scrambled to its feet and pawed its face. In those few seconds the white cow flashed into view again. She saw the wolf rubbing its eyes; down went her head, and she butted him in the ribs. The beast rolled over and over, staggered to its feet and ran for the range; its companion was at its heels, and the old cow was after them both. Then the mill broke, and the cattle poured out on the plains.

What became of the three other wolves we did not wait to see. Believing that the mill would break with the firing of the gun, we had run for our lives, and it was lucky we did, for the stampede passed over the spot where we had been standing.

At sunset the old white cow and Blackie, with Starlight between them, came quietly home. Then Belle and her precious offspring tagged meekly behind.

The next morning I found Polly seated on the ground, weaving a sagebrush wreath. She held it up for me to admire. "It's for The Antique—I mean dear Daisy," she said, correcting herself. "We mustn't call her queer names any more. This wreath that I'm weaving is a present from Starlight to show Daisy how much she loves her."

CARE OF THE SKIN
By A. M. H.

No part of the body deserves more careful study and attention than the skin, for the body is constantly trying to throw off waste matter. This waste matter is intended by nature to be taken care of and carried off by the bowels, the kidney and the myriads of pores of the skin. So intimately related is the skin to the other great eliminating organs of the body that its sluggish action tends to a diseased condition of these organs. The majority of people neglect the body in the way of frequent washings, and many an ache and pain as well as sickness and severe cold, lies exactly at the door of this neglect.

Crow's feet and wrinkles perhaps disfigure a face more than anything else, and it is well to avoid worry and anger for it is a well known fact that they write fine lines which deepen into wrinkles on the face, and hard water will ruin the best complexion and make the wrinkles come long before they should. Rainwater is best. If this cannot be obtained, distilled or boiled water should be used.

Any woman can prepare her own face powder at home and at very small cost. One of the best and safest to use is made with three parts of cornstarch to one of boric powder with a few drops of perfume added, and this makes an excellent powder for infants and young children.

For body moisture, a powder made with one part of the boric powder, two parts of zinc oxide and four parts of pulverized starch is much used. A lotion for greasy or oily skin is made by dissolving one-half dram of the boric powder in six ounces of rose water and one-half ounce of witch-hazel that is the cause of pimples and black-

This way:

-or this way:

-or this way:

PRUNES STEWED—Wash prunes, cover with warm water, and soak over night. Heat slowly [in water in which they were soaked] to simmering point. Cook until tender but not broken. Slow cooking develops flavor and the natural fruit sugars so that little if any sugar is required. A fireless cooker is excellent for cooking prunes. Soak as directed, heat to the boiling point then set in fireless cooker for several hours.

PRUNES BAKED—Wash prunes, cover with warm water and soak over night. Put prunes in a covered baking dish or bean pot, adding the water in which they were soaked. Bake in a very slow oven until fruit is tender but not broken. No sugar is required. The *baking* brings out a new "relishy" flavor in prunes. Served with cream, plain or whipped, or a boiled custard sauce, baked prunes make a splendid dish.

PRUNE JUICE—Wash Prunes, cover with warm water; soak over night. Heat slowly [in water in which they were soaked] to simmering point; cook until fruit is tender and somewhat broken. Keep under boiling point during entire cooking period; no sugar is required. When cooked pour off juice, strain through a fine sieve. The prunes remaining can be pitted and used for prune desserts requiring prune pulp.

heads. A good lotion to use to close
the pores after bathing the face is
made by dissolving one dram of the
same powder in four ounces of witch-
hazel. The moment pimples and cold
sores appear on the face take a dose
of citrate of magnesia, which will cool
the blood and put the system in better
condition, and the cause of all skin
troubles is more than skin deep.
When taking long walks or rides, pro-
tect the skin by using a lotion made
with the well beaten white of egg
mixed with carbonate of magnesia and
wear a thin veil.

HINTS FROM HOUSEKEEPERS

Bran Cookies

I am sending a recipe for bran
cookies which we like very much:

One-third cup shortening, one-half
cup sugar, one-half cup molasses or
honey, one egg, one-fourth teaspoon
baking soda, one-half cup water, one
and one-half cups flour, two teaspoons
baking powder, two cups bran, one-
half cup chopped nuts, one-half
cup raisins. Cream butter and sugar,
add liquid ingredients and then dry
ingredients, saving enough flour to
flour raisins and nuts. Add nuts and
raisins last. Drop from teaspoon upon
a buttered pan and bake about 15
minutes.—Stella Haverland, Santa
Barbara.

RABBIT PIE AND DUMPLINGS

Rabbit may be transformed in much
the same way as chicken. Among

other suggestions are the following:
Canned rabbit (prepared like canned
chicken), rabbit salad, rabbit rolled in
bread crumbs, seasoned, browned and
then put into the fireless cooker and
cooked until tender, rabbit pie, and
rabbit with dumplings.

Rabbit Pie

Clean, dress and cut up the rabbit.
Put in stew pan with onion, parsley,
etc., cover with water and cook slowly
until tender. When half done, add salt
and pepper. Put a small cup in the
center of baking dish, put the rabbit
meat around it, cover with pie crust.
Make incisions in the crust so that
the steam and gas may escape. Wet
the edges of the crust and put on a
little edge of crust around the pie.
Bake in the oven until the crust rises
and browns.

Dumplings

The following recipe for dumplings
should be followed to be used in com-
bination with rabbit: Take two cups
flour, one-half teaspoon salt, 4 tea-
spoons baking powder, 2 teaspoons
butter, three-fourths cup milk. Mix and
sift the dry ingredients. Work in the
butter with the finger tips and add
milk gradually, mixing with a knife.
Toss upon floured board, roll to one-
half inch thickness, and cut with the
biscuit cutter. Place the dumplings
in a buttered steamer, put over a ket-
tle of boiling water and steam for
about 12 minutes. If a steamer is not
available use a perforated pie tin.—
Mary Ann Gray, South Dakota State
College of Agriculture.

American Berkshire Congress

The American Berkshire Congress
and Sale did not have the nation
wide representation which was ex-
pected and this because of some thous-
and and one combinations of circum-
stances which prevented several east-
ern Berkshire breeders attending the
congress at Riverside. Those who
were able to attend, however, "arove"
and united in the holding of a great
meeting and in holding a sale, a short
account of which was given in the last
Cultivator and which was entirely sat-
isfactory. The managing committee
feels highly gratified and especially
appreciates the cooperative spirit of
several firms of the west which united
in putting over the show. The prin-
cipal jolly up feature of the congress
was held at the Mission Inn at River-
side on Tuesday eve, February 20.

The Banquet

The banquet opened with a song, by
Mrs. Geo. Stingle, in the costume of
an old English caterer, the singer be-
ing followed by the chief cook bear-
ing upon his shoulders a huge tray
upon which was a Berkshire pig,
roasted whole. Feast and merriment
reigned. Prof. E. H. Hughes of the
University of California was the toast-
master and presided with pleasing
manner. Mayor Evans of Riverside
gave a very cordial welcoming speech

which was followed by short talks by
prominent visitors throughout the
state. These included Prof. Gordon
H. True, head of the animal husband-
ry department of the university; Prof.
A. W. Oliver, head of the swine divi-
sion of the Oregon agricultural col-
lege; Dr. E. R. Cahill of Indiana; Chas.
Brouse, president of the Riverside
chamber of commerce; H. A. Miller,
livestock representative of the Los
Angeles chamber of commerce, J. A.
McGregor president of the Southern
California Fair Association; Mr.
Booth of Chaffey Union High School;
and Harold Anderson, high man in the
Riverside Junior Judging Contest
team that won the beautiful silver
cup offered by the Southwestern
Berkshire Congress.

The fun was provided by the little
daughter of Fred Hall, newly elected
president of the Southwestern Berk-
shire Congress, in the way of hu-
morous recitations, and two original
Berkshire songs written for the oc-
casion by Mrs. Stingle and sung by her-
self and Mr. Stingle, the title of one
of the songs being, "Watch Berkshire
Breeders Take the Hills in High."
Secretary Stingle provided the very
unique surprise of paying the winning
breeders their cash prizes in real Cal-
ifornia gold.

(List of the winners next week.)

Exhibitors and Officers at the Berkshire Congress at Riverside.

The upper photograph show the exhibitors; the lower one the exhibited. The
three barrows made up the grand champion pen of the Berkshire show held at River-
side last week. This pen was shown by the University of California and was the
winner of the cup offered by the chamber of commerce at Riverside.

The Safe Tonic

embodies elements that
restore strength and
build up the body
via nourishment.

Scott's Emulsion

is a form of tonic-
nourishment that
makes for a sound
body and abund-
ant vitality.

Scott & Bowne, Bloomfield, N. J. 20-36

Take KI-KOIDS for Indigestion.

DR. HESS DIP and DISINFECTANT

Use the
sprinkling can about
your premises—the dipping
tank where the occasion de-
mands. For your hogs, a wal-
low is the most convenient, and
quite effective. To every 70 to
100 gallons of water add one
gallon of Dr. Hess Dip and Dis-
infectant. Then your premises
—the cow barn, the stables, the
pig pen, the poultry house, the
sink, drains, closets, cesspools
—everything, everywhere, will
be pure and healthful.

You can dip, or you can spray
or sprinkle, or apply with a
sponge or brush, Dr. Hess Dip

SHORTHORN SALE A BARGAIN EVENT

That the annual sale of Shorthorns held by the California Shorthorn Breeders Association at the university farm, February 22, failed to register as strong values as the offering merited was due, no doubt, to the fact that the Hereford sale the day before furn-

For the Grand Champion Herd.

This is a photograph of the silver cup offered by the California Cultivator and won by the Italian Vineyard Company of Guast. It was given to the grand champion herd at the American Berkshire Congress at Riverside.

inished many of the buyers with what bulls they needed and that the crowd attending Stockmen's Week was not large enough to absorb the two large sale offerings. In the future, more buyers must be attracted or fewer cattle offered. It is not too much to say that the offering presented was easily the best lot sold in any of the association's spring sales and reflects the splendid improvement that has been underway in California herds during the past two years. While the consignments were quite uniform the buyers, as in the sale the day before, showed a preference for the better lots. An interesting feature of the sale was the fact that the major portion of the offering was contributed by the younger breeders.

The top of the sale was \$675 which was paid for the attractive young bull, Missie's Pardale, from the Elberg herd by W. J. Fulgham. The highest priced female was the red junior yearling daughter of Imp. Caledonia sent in by Howard Vaughn of Dixon. She was purchased by Senator Benj. F. Rush of Suisun for \$300. For the most part buyers showed little preference between the Scotch and Scotch topped sorts. Jack Metzger of Red Bluff, W. J. Fulgham of Visalia, James Barry of Cottonwood and T. H. Ramsey of Red Bluff were the largest buyers.

The sale was managed by Howard Vaughn and Cols. Hull and Davis were the auctioneers. The average established on the bulls and females was \$170.

The principal sales follow:

Consigned by Fair Oaks Ranch, Willits
1. Golden Sunbeam, 2d, red, Jan. 1917; W. J. Fulgham, Visalia, \$170.
2. Fair Oaks Victoria, red, Jan. 1921; Fulgham, \$225.

L. W. Bardsley Herd
Tulare, Calif.

Tuesday, March 14, 1922

Owing to the pressure of other interests, Mr. L. W. Bardsley, Tulare, has decided to make a complete dispersal of his herd of registered Holsteins. Most of the cattle in this herd are young, of good type, and representing most desirable blood lines.

The herd sire, PRINCE RIVERSIDE MEAD, is in the sale. He is a son of the famous King Mead of Riverside, out of a 26 lb. daughter of the century sire, Changeling Butter Boy, next dam a 36 lb. daughter of the century sire, Tidy Abbekerk Prince.

THERE ARE 15 DAUGHTERS of Prince Riverside Mead in the sale, and remember that they are granddaughters of King Mead of Riverside.

SANTA ANITA RANCHO

OFFERS FOR SALE

REGISTERED PERCHERON AND ARABIAN STALLIONS

MAMMOTH JACKS AND JENNETS

HOLSTEIN-FRIESIAN CATTLE

BIG TYPE POLAND-CHINA SWINE

The registered Percheron Stallions offered are an exceptionally fine lot of high-class young horses, of great size, style and quality, from two to five years old.

The Jacks are the big-boned, rangy kind so much desired and sought after by the discriminating breeder who likes to breed and raise a big work mule.

The Jennets are young and mostly all in foal to King Bersheba.

The registered Holstein-Friesian Bulls are twelve to eighteen months old, sired by Prince Walker Cornucopia and out of high yearly-record dams.

All Breeding Stock Guaranteed.

SUITABLE TERMS OF CREDIT MAY BE ARRANGED.

CORRESPONDENCE SOLICITED.

The 1922 Guaranty Sale

"THE PACIFIC COAST HOLSTEIN CLASSIC"

65 TOP REGISTERED HOLSTEINS

Rhoades & Rhoades Sale Pavilion

HYNES, CALIFORNIA

Wednesday, April 5, 1922

This will be one of the very best offerings ever made in the West, and the sale comes at a time when the promise for establishing new herds was never better.

At least twenty herds will be represented, the largest number that have yet appeared in this annual event.

Approximately 40% of the cattle were selected from southern California herds and 60% from north of Tehachapi.

Many of the most famous sires in California will have daughters or sons, or both, in this offering, and the list of reference sires is the greatest that has yet appeared in a Western sale.

The offering will include the highest record cow ever sold at public sale in the West, and she is due to calve two weeks after sale to the noted young sire, Sir Aaggie Mead.

To Holstein Owners North of Tehachapi:

Make this sale the occasion for a trip to Southern California—it will be worth your while, even if you do not want to buy.

Do You Know

- THAT Los Angeles County leads the counties of the State in number of registered Holsteins by a considerable number?
- THAT no other area of equal size in the entire West has so many high-record herd bulls in active service as there are south of Tehachapi?
- THAT among these high-class sires there are FIVE that sold for from \$10,000 to \$41,000 each?
- THAT Southern California breeders have registered Holstein breeding females not surpassed, and probably not equalled, in numbers and quality in any area of like size in the entire West?
- THAT Southern California has the largest, strongest and most active local club of Holstein breeders in California?
- THAT you are not keeping abreast of Holstein progress in California unless you have seen the great Southern California herds and breeding farms?

This is a wonderful season of the year to drive from the North to Los Angeles, either by the Valley Route or the Coast Route—splendid paved roads practically all the way.
Plan now to make the trip.

This is a Wonderful Group of Holsteins for Foundation Breeding Material, and the One Opportunity of the Year to Find so Many Animals of this Quality in One Sale

Every animal tuberculin tested and sold subject to 60-day retest by the buyer; every animal positively guaranteed to be a breeder.

The usual liberal terms will be granted by California Breeders' Sales and Pedigree Company to purchasers who make arrangements for credit before sale. Applications for credit may now be made by mail or in person.

LIVESTOCK SALE CALENDAR

Holsteins

March 14, L. W. Bardsley, Tulare.
April 5, Guaranty Sale, Rhoades & Rhoades, Pavillon, Hynes.

C. G. Lamb, superintendent of the H. G. Ranch of Duelltown, writes regarding the purchase by Captain Gantz of three cars of purebred Ayrshires brought in from the state of Washington. In a sale offering a bunch of cows from this herd the average per cow was better than 50 pounds butter for the month of November. There are certainly no culls in that bunch, but they are to be disposed of to make room for the recent large purchase.

Earl J. Cooper, assistant state club leader of Wisconsin, has been employed by the Holstein-Friesian Association of America to take charge of their calf club work under the direction of President Lowden.

Edward Cebrian, manager of Calodonia Farms, West Sacramento, has loaned to the University of California the Shorthorn bull, Pine Grove King 21st. This bull was shown as a senior yearling at last year's fairs and was second in class at the California state fair. He is a son of Pine Grove King, one of the real bulls of the breed, and his dam is a Victoria by Glennbrook Marquis. Individually, Pine Grove King 21st has much to recommend him and with his rare bloodlines it is expected that he will leave his impress on the university herd.

Bellevue Daisy, grand champion cow at the Pacific International Exposition, Portland, Oregon, last November, showed on the fair circuit from the first of September until the latter part of November. She gave from 35 to 40 pounds of milk a day during this time. She weighs 1,700 pounds and is owned by Innisfall Herd, Davis.

The top Poland China sale of the year was recorded February 6 when Frank R. McDermand of Kansas City sold 34 sows and gilts for an average of \$220. The highest priced sow was sold for \$600.

Hereford breeders are mourning the loss of the great sire, Beau Blanchard. This bull was rated as one of the most successful sires of recent years and had to his credit many sons heading leading herds. He was the sire of Beau Blanchard 76th, owned by Cazler and Sons of Wells, Nevada, and The Peer, now at the head of John A. Bunting's herd at Mission San Jose.

Chas. J. Lemoyne of Lankershim purchased the top sow in the record Duroc sale of the year held by Ed M. Kern of Nebraska. This sow is Cherry Lady, dam of Sensation Leader, the boar that stood first as a junior pig at the 1920 National Swine show and that sired the junior champion sow at the same show last year. The price paid was \$660 and the general average of the sale was \$294 on 70 head.

E. F. Peterson, manager of the Diablo Stock Farm, Danville, writes that sales from their Polled Hereford and Duroc herds have been highly satisfactory during the past few weeks. Besides 16 bulls recently purchased, James Bardin of Salinas has selected 12 head of choice females and a bull as foundation for a pure bred herd. Chas. Bardin also selected 12 females and a herd bull. R. M. Burbidge of Paso Robles bought two yearling heifers. Otto Jorstad, Lincoln; Johnson Bros., Chualar; W. W. Boardman, William and Kroll and Co., Guam, P. I., are among the list of buyers.

Mendocino County, not to be outdone by Humboldt County or by Sonoma and Marin Counties, is now finding a place in the sun with the purebred stock idea. Round Valley, with Covelo as the hub, is the particular spot in interest. The dairymen at Covelo and in its vicinity, having awakened to the importance of making use of their natural advantages, have arranged with the state department of agriculture to have all their

herds, not fewer than 1600, given the tuberculin test. In addition, the dairymen have just bought a carload of purebred Jersey bulls and heifers. The purchase of this stock was under the supervision of Frank B. Astrot of the American Jersey Cattle Club Professor V. C. Bryant of the college of agriculture, and F. E. Buck of Eureka.

The Braemer ranch reports the sale of all their imported Angus cattle to F. Peabody. Also the same ranch reports sale of Hampshire gilt to Borden Bros of Trinidad.

THE STATE DAIRY COW COMPETITION, 1920-1922

(Continued from Page 261)

fat per month per head for the entire period of the competition, ranging during the different months from 83½ to 43½ pounds butter fat per month.

The record period adopted in this competition was the same as in that of 1916 to 1918, viz., ten months, or rather, 305 days. The reason for de-

Homeward Bound — Eager to be Milked

Cows with healthy udders and teats "give down" the milk easily, freely. The slightest injury or discomfort means a sure milk-loss.

Bag-Balm pays for its slight cost many times over in providing a sure, quick relief from udder troubles. Sores, chaps, cuts, scratches, inflamed tissues, hardened or swollen teats, caked Bag—an abnormal udder condition is quickly cleared up by this great penetrating, healing ointment.

RIDING THE MUDDY ROAD TO MARKET

Copyright 1922, by The Goodyear Tire & Rubber Co., Inc.

"Of all my farm machinery, no one thing is more profitable to me than my truck on Goodyear Cord Tires. It does the work of three teams and speeds up every farm task, especially the hauling of cattle to market. Our local Goodyear Dealer, Rossville Motors Company, renders helpful service on them regularly."—HAROLD MANN, Speedwell Farm, Rossville, Illinois

SPRING turns the country roads to mud, and then the farmer's Goodyear Cord Truck Tires reveal their all-year-'round utility.

On the hub-deep roads and in the soft going of fields and lanes, their All-Weather Tread wins swift and powerful traction. The active pneumatics make more trips per day, cover more ground, and deliver perishable product to market in better condition.

As the roads dry and the ruts harden, the greater strength of Goodyear Cords is demonstrated in their sure dependability and their remarkable mileage at low cost.

Their lasting resilience is a cushion to the load and the driver, and a protection to the valuable truck and the improved road.

Write to Goodyear, Akron, Ohio, or Los Angeles, California, for actual reports of farm hauling on Goodyear Cord Truck Tires.

iding upon a ten month period has been fully gone into before; since the ten month records were first introduced into this country in the competition of 1916-18 they have been adopted as a prize division by our main dairy breed associations, and bid fair in time to replace the yearly records, at least in interest and importance to most breeders of dairy cattle. The great advantage of a ten month period lies in the fact that it renders it possible for breeders to obtain long time records of production of their cows without interfering with their regular breeding. Many of the high record cows of the past were never heard from after they had completed their records; by delaying service until late in the lactation, especially with the liberal feeding methods practiced, it proved difficult as a rule, and often even impossible, to get them in calf, and their future usefulness in the dairy was therefore brought to an end. The ten month period allows the breeder to secure a record and a calf too, and we have abundant evidence by this time showing that very high records of production may be secured under normal dairy practice as to time of breeding and calving when conditions generally are favorable.

sible for breeders to obtain long time records of production of their cows without interfering with their regular breeding. Many of the high record cows of the past were never heard from after they had completed their records; by delaying service until late in the lactation, especially with the liberal feeding methods practiced, it proved difficult as a rule, and often even impossible, to get them in calf, and their future usefulness in the dairy was therefore brought to an end. The ten month period allows the breeder to secure a record and a calf too, and we have abundant evidence by this time showing that very high records of production may be secured under normal dairy practice as to time of breeding and calving when conditions generally are favorable.

One of the rules adopted in the competition provides that cows must be bred before the end of the fifth month from freshening. In spite of this liberal provision a considerable number of cows were not with calf within the time limit set and were therefore barred from competing for other prizes than those for monthly records and for the trophies offered by the respective breed associations. As might be expected a higher percentage of heavy yielding cows were barred for this reason than low producers, and the percentage of pure bred cows barred was likewise higher than that of common or grade cows; but nearly every herd represented had at least one or two cows that came under the ban on account of failure to breed; 31 per cent of the pure bred cows completing the record period were not bred within five months from calving and 17 per cent of the grades, or 21.5 per cent of the total number of cows.

Another restriction to the award of prizes was imposed in the case of pure bred, that they must produce at least 350 pounds butter fat in ten months. This barred others, but not many; about 30 out of all the pure bred cows completing the record period.

The period for entering cows in the competition extended from September 1, 1920, to April 1, 1921. Cows were entered as they freshened during this time, at the option of the owners, and records of production were therefore completed and published from month to month from July, 1921, on. At the close of the competition on the last of January this year 595 ten month records had been completed, and 634 yearly records of cows in herds belonging to a cow testing association, deducting duplications, complete records for 1,260 cows owned by 64 dairy farmers or breeders were thus obtained in the competition, as against 608 cows in 34 different herds in the former competition, an increase of close to 100 per cent in the number of both complete records and owners directly interested in the competition.

The prizes were donated in 1920 by breeders of dairy cattle and business firms interested in the development of the California dairy industry. A cash prize fund of over \$3,000 thus became available, which was set apart for 12 prizes of \$100 to \$300 each for the highest production of butter fat by ten cows in the herd during ten consecutive months and for 16 prizes of \$25 to \$100 each for ten month records made by individual cows. In addition a large number of special prizes of money, silver trophies, registered dairy bull calves, and a Babcock 24 bottle hand tester were donated, making 70 prizes provided for in all, of a total value of approximately \$5,000. The college of agriculture and the fortunate winners are under obligations to the donors of these various prizes who so generously gave of their means to the further promotion of our dairy industry. I take pleasure in publicly acknowledging our indebtedness to them, expressing the hope and the belief that the results of the interest which their gifts gave to the competition will aid materially in making dairy farming in this state a good business to follow, one that will give adequate returns measured in human contentment and happiness, as well as in increased prosperity.

The final list of awards is necessarily held over till next week.

During January, 907 cows were tested in the Stanislaus County cow testing association. 100 produced over 40 pounds butterfat.

More than a Labor Saver

Perhaps the thought has occurred to you—"Why buy a milking machine when help is so plentiful?"

Help usually must be paid for, whether it is plentiful or not; and one dollar saved now is as much as two dollars saved a short time ago.

But with the De Laval you can afford to disregard time saving entirely. The De Laval Milker will save more time and labor than any other milker; but even if it didn't save a minute's time it would still pay you to use one. Why? Because it milks your cows better. It milks them with the same uniform action from milking to milking, day to day, or year to year, no matter if you use one or a dozen units. It combines all of the best features that have ever been developed for milking. It is not merely a substitute for hand milking, but actually better.

Cows are well milked the De Laval way; they like it, and because of this they invariably produce more milk than under any other method of milking.

De Laval Milker users, and there are thousands of them, are almost unanimous in their agreement that the De Laval Milker does increase production, either immediately or over a long period of time—and that the cows' udders and teats are kept in a better condition than with any other method of milking. It is just such favorable results as these that so agreeably surprise De Laval owners, many of whom say they would sell their cows if they couldn't have a De Laval.

Send for "The Better Way of Milking," which contains information from users.

De Laval Pacific Company
61 Beale Street San Francisco

Sooner or later you will use a De Laval Milker and Cream Separator

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERO SIRE.

OWNED JOINTLY BY
Fred Hartsook and A.W. Morris & Sons Corporation

POULTRY

Profitable Poultry News Just Received— Capacity 200,000 chicks, hence prices surprisingly low for quality. One recent order of County Farm Adviser's was 5,000 White Leghorn, 2,500 Brown Leghorn, 850 Red chicks. His orders are coming after two years' extensive trial of our chicks throughout his county. "Had the pleasure of seeing some your Anconas, White Leghorn pullets. They are grand." "Your Barred Rock chicks bought May, 1919, proved great winter layers. Had such good success with your chicks last year, am ordering again." These strains, 180-290 egg Leghorns, Rocks, Reds, Anconas, Wyandottes, Minorcas, Andalusians, ducks, turkeys, early lead many egg laying contests, supply foundation stock, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter laying, profit, guarantee. Booking for immediate future delivery, below pre-war prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 No. Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

Have you had satisfaction with your **BABY CHICKS?**

If not, give us a trial. Our chicks give satisfaction.

DAY OLD DUCKS on orders.

STEELE'S EGG RANCH. Phone Gardena Exchange 692. Moneta, California.

Prompt Deliveries on Mail Orders. ANGELUS ROOFING & PAPER CO. 764-766-768 So. San Pedro Street, Phone Bldgway 5401 Los Angeles Calif

MACHINERY

Wm. F. Lutz Company, Santa Ana, California. Farm implements, tractors, trucks, trailers. A full line of implements, tractor and horse drawn. Moline, J. I. Case and Fitch Four Drive tractors. Moline and Army trucks. Two wheeled Utility and army trailers. Harness made to order, repaired or oiled. Some good second hand tractors and tools.

For Sale: Fine Deep Well PUMPING PLANT, 15 h. p. Western engine, just reboared. Famous double acting AMES pump with friction pulley, 8 inch casing, 7 inch brass double acting cylinder, double rods for 120 ft. well; for cash or trade for late model Dodge auto. Demmitt Co., office upstairs, 120 N. Main, Los Angeles.

For Sale: Rebuilt windmills, tanks, pumps, cylinders. Make galvanized tanks, 400 gal., \$16.25; 600, \$26.25; 1,000, \$36.25; 2,000, \$48.25. Irrigating pipe, all sizes, for less. Why pay more? Demmitt Co., office upstairs, 120 N. Main, L. A.

HEREFORDS AVERAGE \$163 AT DAVIS

The annual spring sale of the Pacific Coast Hereford Breeders Association was held at the university farm, Davis, during Stockmen's Week and was in a measure a disappointment to the consignors, the 68 head of bulls and females making the general average of \$163. While the level of values can be regarded as quite conservative it represents a considerable penalty to breeders presenting breeding material in poor condition. Throughout the sale the buyers showed a disposition to set fair prices on the better sorts and in nearly every instance a

premium was paid for quality and condition. That fact should be taken home by all breeders who court patronage at public vendue. Furthermore California cattlemen are becoming mighty discriminating in making their selections.

The sale consisted chiefly of bulls and for the most part these were taken by range operators. The A. S. Nichols Co., Sierraville, made selections from the top sorts and J. G. Taylor of Lovelock, Nevada, was the heaviest buyer—taking ten head. W. S. Orvis of Stockton who has been an extensive buyer for the past year added ten females to his herd. S. R. Crowe of Pleasanton secured one of the real bargains when Don Woodford 4th fell to his bid of \$425. J. R. Scheimer of Princeton paid the top price of \$450 for the attractive young bull consigned by the university.

The sale was managed by the California Breeders' Sales and Pedigree Company, Sacramento and Col. H. L. Hull of Iowa was the auctioneer. Col. Davis of Manteca assisted in the ring.

For the Benefit of the Beginner

AS A rule it is always the safest plan for beginners to be guided, to a degree at least, by the experiences of the successful poultrymen in the same neighborhood. Through costly experience and close observation these men have learned that certain methods of yarding, housing, breeding or feeding are best in that particular locality.

Location

When we consider the production of perishable commodities, especially eggs, which must be marketed very promptly, nearness to market is a most important item. Under the intensive system which surrounds egg production in Southern California the price of land within reasonable limits is not a controlling factor. In other words, it seldom pays to buy cheap land remote from market with the idea of saving expense. A poultry ranch should be located either on a boulevard or a good road so that eggs may be handled at lowest cost. The price charged for hauling eggs or feed is dependent upon ease of access. Where the arrangement of the ranch makes loading difficult no feed dealer can make the lowest price, and no truckman wants to drive into premises where he is in danger of getting stuck in mud or sand.

Water

If Southern California is to become one of the leading poultry sections of the United States it will be because our hens have green feed the year round. Abundance of water is necessary for growing this feed. Anyone buying land for a poultry project will do well first to investigate the water supply for irrigation. Good management can overcome many other difficulties, but a poultry ranch without water is hopeless.

Fundamental Problems

Four great problems face the beginner in the poultry business: incubation, brooding, egg producing marketing. Finding a solution for anyone of these is a man sized job. Yet the beginner, as a rule, having small experience, is face to face with the entire group and must solve them in one way or another.

Incubation

It is well for every poultryman to know something practical about incubation, yet for the beginner to invest in an incubator room and high priced equipment is seldom good business at first. The hatching of chicks has been so standardized that it will not be difficult to secure strong, well bred chicks at a moderate cost.

Brooding

It is not possible at the present time to have brooding done by a specialist. The efforts to establish great brooding plants have, up to the present, not proven successful. Unfortunately it is necessary, even for the beginner, to make arrangements to brood his own chicks.

The three fundamental things which must be considered in brooding chicks are fresh air; proper temperature which will make all the chicks comfortable, especially in the morning; and moderate feeding. We wish to bear down on fresh air and overfeeding. A great many chicks are overfed, especially in the afternoon. Any chick which comes out in the morning with feed in its crop was overfed the day before.

Egg Production

Egg production is the thing which will make or break the poultryman. It will cost at present prices from \$1.50 to \$2 to feed a hen one year. A hen must lay eggs to this amount before she pays for her board. For this reason the production of eggs is the keystone of the poultry industry. It is practically impossible to show a considerable profit unless a reasonable percentage of the eggs marketed are sold in the fall and winter. A great deal is being done in every section of the country to build up the quality of the laying stock. The most profitable are the so-called 'laying strains.' When we have secured laying hens or pullets from such stock, feeding is the next consideration. The

Southern California poultryman is at present face to face with the fiercest competition from middle western farmers. It is therefore necessary that California poultrymen, with their superior skill, ability to produce eggs when eggs are high, and the ability to supply eggs of uniform quality, more than offset the advantage which the eastern grower has with cheaper feeds. For a little more than two years, Southern California has been shipping eggs to the eastern markets and so far has been very successful in meeting competition. The California poultryman, however, cannot afford to waste money buying feeds which will not give the highest results. While chemical analyses are valuable, it requires a feeding test to form an intelligent conclusion. The selection of good breeding cockerels is of great importance, but in our opinion, proper feeding is of still greater importance, because it is possible to demonstrate that through improper feeding, the chicks hatched are not normal and the losses from the very beginning are excessive. This loss extends beyond the brooder stage into the laying house.

Marketing

Where the beginner has but a few hens, it is probable that he will find a local market for his product, or he can with advantage perform the marketing service and secure an increased return on his product; but where he has 500 hens or more, the increasing amount of time which it takes will soon tell on the production of his flock. In other words, if time is spent in marketing which should be spent in caring for the hens and thus securing the largest production, then the whole proposition is in danger of failing from neglect of the poultry itself.

The great marketing associations are formed especially to take care of this very problem, and these associations are constantly growing in power and importance. Sooner or later, the poultryman should investigate the advantages of selling his eggs through the organization. If our marketing problems in Southern California are met in an intelligent way, and if the poultryman will show equal intelligence in feeding his flocks, there is nothing to fear from present conditions. The production of eggs in this district has grown to immense proportions. It would be folly to continue to increase production when one-fourth to one-third must already find a market outside the state unless efforts be made at the same to develop outside markets. As a whole, the poultry industry of Southern California is abreast of the times in brooding, feeding, egg production and marketing.

To build up a great industry in Southern California, we need only to follow the lines already laid down. This will give employment to many who are seeking homes in California and also bring to the state large returns from eggs sold in New York and other eastern markets. We anticipate that it is only a question of time until the California cold storage egg will stand as high in the estimation of buyers in the east as the California extra fresh does at the present moment.—The Cooperative Poultryman.

SOUTHERN CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The Rhode Island Red pen owned by Ferd Heying takes first place for pen production for January with 174½ eggs, while Geo. C. England's White Leghorn pen is a close second with 173½ eggs, and California Leghorn Breeders third with 171½ eggs. The Anconas make their first appearance among the higher producers, C. W. Norton's pen taking a place with the highest ten pens.

For individual production the Rhode Island Reds win both first and second places for the month, birds belonging to Ferd Heying laying 27 and 26 eggs respectively. Third place was taken by G. B. Wilken's White Leghorn No. 307 with a production of 25 eggs for the month.

The egg production for the contest flock for January was 28.23 per cent. The birds consumed on an average 2.64

NEWS FROM FARM BUREAU EGG LAYING CONTEST

The production of the 62 ten hen entries is rapidly climbing with the approach of spring. The average yield for the 31 days of January was 44.4 per cent, an increase of 11.9 per cent over December. Alex. Stewart's pen of heavy producers still holds its position as leading pen which it has held since the beginning of the contest, October first, but it has at last had to step aside in favor of R. H. Young's ten promising layers as high pen and blue ribbon winner for the month. Mr. Stewart and his ten splendid pullets are to be congratulated for it is not often that one pen will so consistently hold the lead and at the same time win the blue ribbon for high pen for the month in three consecutive months. Alex. Stewart's pen took second ribbon for January production and Bolfin's Poultry Farm of Gilroy came third. Stewart's hen again won first ribbon for high hen for the month with a yield of 28 eggs, making her total to date 107 eggs, which is the highest individual score in the contest to the present time.

The high hens for January are owned by Alex. Stewart and Mrs. Kleinsmith, 28 eggs; Hollywood

PACKERS OF AIRLINE HONEY

Farm, W. H. Marshall, Alex. Stewart, R. H. Young, Komatsu, H. C. Kleinsmith, 26 eggs.

Fourteen individuals have laid 75 per cent or better for the first four months, and the ten highest are: Stewart, 107 eggs; Kleinsmith, 104 (Barred Rock); Marshall, 104; Thornehill, 102; Stewart, 102; Thornehill, 98; Corbett, 97; Stewart, 97; Russell, 95; Hanson's, 94.

This month the contest flock consumed an average of 8.83 pounds of mash and 11.1 pounds of grain per 100 hens per day at a cost of 12.37 cents. The mash cost \$2.28 and the grain \$1.80 per 100 pounds.

Poultry Queries

Conducted by Jean A. Koethen

Hens With Spurs

Some of my White Leghorn hens, one year old, have spurs like a rooster. Would you advise cutting the spurs off, and would you cut them off smooth or just pull off the cover?—Subscriber, Cloverdale.

Cut the spurs off smooth, but not too close to the shank. I do not know why the hens of some strains grow spurs as they advance in age. The thing seems to be congenital, and is not uncommon in old hens though rare in young ones. If you wish to breed out the tendency do not use these hens in the breeding yard.

Vegetable Protein

Why do most laying mashers contain soya bean meal and oil cake meal, and what is the food value and digestibility?—Subscriber, Glendale.

Soya bean meal and linseed oil cake meal are rich in vegetable protein, the oil cake having a nutritive ratio of 1 to 2 and the soy bean a ratio of 1 to .9. Digestibility of protein in oil cake is about 25 per cent and in soya bean nearly 30 per cent. These vegetable meals are somewhat cheaper than meat, and when used in a mash with meat give apparently as good results as meat alone. Experiments at Davis showed that when vegetable and animal protein were used half and half in the laying mash the hens produced as many eggs as when all animal protein was used.

Narragansett Turkeys

I have Narragansett turkeys and would like to communicate with some one else who has this breed. Mine are the Silver Tipped Wild and Black Mohawk.—A McCall, Watsonville.

Mrs. T. T. Middleton of Lone Star Ranch, Lankershim, very kindly sends a list of Middle West breeders of Narragansetts. The list includes Mrs. Perry Meyers, Fredonia, Kansas; F. L. Peterson, Asherville, Kansas; Mrs. Charles Dietz, Manchester, Oklahoma, and others.

White Orpingtons

In looking over the Cultivator poultry ads I notice there are several Buff Orpington ads but none of White Orpingtons. Is this because Buffs are better than Whites? I have been told that White Rocks are the same as White Orpingtons. Is this true? I should like to buy a little White Orpington stock.—Subscriber, San Gabriel.

I believe Buff Orpingtons have a better reputation as layers than the Whites. At any rate they have made better records in some of the egg laying contests and have always been more popular. White Orpingtons have not been bred extensively in California and are seldom seen outside the show room. The White Rock is a smaller bird than the White Orpington and is an American breed while the Orpington is English. White Rocks have in general the same characteristics as the Barred Rocks.

Ipecac for Turkeys

Will you please tell me how to use ipecac for blackhead in turkeys?—Subscriber, Prosser, Wash.

The ipecac treatment, as recommended by the Doctors Wegeforth of San Diego, consisted in separating the sick birds from the flock and giving them 10 drops of fluid extract of ipecac three times a day, continuing this

dosage for three days and then decreasing to 10 drops twice a day for three days, and then finally once a day for three days. As a preventive measure a teaspoon of powdered ipecac was given twice a week for each unit of 20 turkeys, and the disease did not appear, at least had not appeared when the report was published.

Culling Pullets

At what age should pullets first be culled by the Hogan method?—Subscriber, El Centro.

Pullets are Hoganized just before they begin to lay, but are culled by appearance, vitality, etc., all winter. Some poultrymen remove from the

flock every pullet that goes broody before July and every pullet that stops laying for any reason whatever during winter and spring.

Brooding

Can you recommend a brooder for 500 chicks? Is not this too many for one flock? Can I brood 500 chicks in a house 6 by 12?—Subscriber, El Centro.

Many poultrymen brood as many as 1,000 chicks around one stove or under one electric hover. There is not much danger of the chicks trampling one another if they are warm and comfortable. Any good brooder stove will hover this number if it is of the proper

(Continued on Page 279)

KROYER BUILT

WIZARD 4-PULL TRACTOR

Has Four Fundamental Exclusive Advantages

DEPENDABILITY

1. The Only Tractor With a Rigid 4-Wheel Drive

The Wizard has all the traction of a track machine—under some conditions more—but without prohibitive up-keep expense of track tractors.

2. The Only Tractor Without Oil or Grease Cups.

Automatically oiled throughout. A great time saver.

3. The Only Tractor That is Absolutely Enclosed.

Every working part, except wheels and fan, protected against dust and dirt.

4. 35% Reserve Power After Delivering Normal Pull.

Built with over-strong parts throughout to support maximum performance.

30 Years of Development

The Wizard is Kroyer Built, and represents 30 years of experience and development by men who know tractors. It is a perfected tractor.

Send for specifications and other particulars

Kroyer Motors Company

Los Angeles Harbor San Pedro, California

QUALITY

Buckeye Brooders Are Profit Insurance

IT isn't the eggs you hatch, it's the chicks you raise that bring profits. The Buckeye

"Colony" Brooders are insurance toward success because they raise every raisable chick at a fourth the labor and half the expense. They prevent crowding, overheating and chilling, which cause that awful mortality that takes the heart out of the raiser. With them chicken raising becomes profitable and is no longer a gamble.

WRITE YOUR GUARANTEE

Buckeye "Colony" Brooders are made in three sizes and burn coal, gas or oil.

For years we have urged the purchaser to write his own guarantee on these brooders and we will sign it and refund the money if at the end of thirty days the purchaser is not satisfied.

Our new booklet, "The Revolution in Chick Raising" gives the reasons for this wonderful assurance of success, tells how poultry raising may be made profitable—and proves our statements. Get it for your guidance. Sent free on request.

HONEY

Continued favorable rains have increased the chances for a heavy honey crop until present prospects are for one of the largest yields that the state has produced. The sage crop has been especially helped by the rain and even the flow of orange is expected to be greater than had been anticipated. Beekeepers are therefore increasingly anxious to dispose of their holdings of old honey before the new crop is ready for market. As a result, the market has a slightly weaker feeling, but there has been little change in prices. Movement to eastern points has been fair to moderate. Light amber alfalfa, while it is probably in heavier supply than any other honey left in the state, has sold in carlots at 6½c per pound for California points. White sage is offered in straight carlots at 10½c per pound and 11c in less than carlots. Light amber sage is offered at 8c in straight cars and 8½c per pound in smaller lots. A few small sales of white orange are reported at 11@11½c per pound, f. o. b. Beeswax: Market dull, supplies ample, but demand light, some selling at 22c cash, 25c in trade.

RICE

Rice Association prices:

Bag, 2.40@2.55 f. o. b. points.

NUTS

IXL almonds, 25 lb.; soft shell almonds, 16; do, hard, 10; budded walnuts, 32; soft shell walnuts, 30; Manchurian walnuts, 14; Brazil, 17; pecans, extra large, 23; Filberts, 14 lb.

HAY AND FEED

A. W. Scott & Co. says:

We quote today wholesale prices in carload lots as appear from dealers transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1.....	17.00@19.00
Wheat hay, fair grade.....	14.00@17.00
Tame oat hay.....	15.00@18.00

Citrus Markets

Los Angeles, March 8, 1922.

Packing houses in nearly all Navel sections are in operation. Shipments from Southern California points are ranging between 50 and 150 carloads per day. Central California is doing but little shipping, only one or two carloads daily. He output was largely cleaned up in the hold day trade. Florida is now shipping around 100 cars of oranges and some days equal as many of grapefruit. Prices being received are entirely satisfactory.

Lemons, on the other hand, are weakening, and inducements to ship at this moment are not large.

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California Oranges, 7,205 cars; lemons, 2,230; total, 9,435. To same date last season: Oranges, 9,389; lemons, 2,118; total, 11,507. From Central California to date this season: Oranges, 4,219; lemons, 99; total, 4,318. To same date last season: Oranges, 4,290; lemons, 103; total, 4,393. From Northern California to date this season: Oranges, 369; lemons, 7; total, 376. To same date last season: Oranges, 305; lemons, 4; total, 309.

Philadelphia: 1 or., 1 lem. Nav. 5.55@6.40, Bloods halves 2.65@2.95, lem. 3.85@4.40.

THE VANISHING RACE

"Every city," says a trade journal

"is face to face with the problem of widening its streets."

Given time, the problem will settle itself. In a few more years the sidewalks can be taken up and given over to vehicular traffic. There won't be any pedestrians left.—Detroit Blaette (Munch).

American Centrifugal Pumps

Every American Pump is guaranteed to meet all conditions specified and to perform the work for which it is sold. If your water problem can be solved with any pump it can be solved with an American. Write for catalogs of horizontal and vertical centrifugal pumps and deep-well turbines and name of your nearest dealer.

WATER POWER OF THE WORLD

Forty per cent of the developed water power of the world is in the United States, where water wheels having a capacity of 9,243,000 horsepower have been installed, according to a recent statement of the United States geological survey. The leading states in developed water power are New York, with 1,300,000 horsepower, and California, with 1,111,000. These state totals compare favorably with those for some of the most progressive countries in water power development in Europe, where France leads with 1,400,000 horsepower, Norway has 1,350,000 horsepower, Sweden 1,200,000 horsepower, and Switzerland 1,070,000 horsepower. The largest percentage of power has been developed in the New England states, where the capacity of the water wheels installed is 1,381,000 horsepower and the estimated potential power at low water without storage is 868,000 horsepower. In the Pacific Coast states, Washington, Oregon and California, the capacity of water wheels installed is 1,893,000 horsepower and the potential power at low water without storage is 11,500,000 horsepower. The largest water power development in the world is at Niagara Falls, where the plants in operation have a capacity of 870,000 horsepower, of which 385,500 horsepower is on the United States side. The capacity of the plants at Niagara is being increased by 114,500 horsepower in the United States and 300,000 horsepower in Canada. Other large plants are one of 170,000 horsepower on the Mississippi at Keokuk, Iowa, from which power is transmitted to St. Louis, and two plants aggregating 268,500 horsepower on St. Maurice River in Canada, from which power is transmitted to Montreal, Quebec and other cities. Canada ranks next to the United States in water power development, with 2,418,000 horsepower, or over ten per cent of the world's total.

Europe has one-third of the developed water power in the world. Two plants at Rjukan, in Norway, have a total capacity of 239,000 horsepower, and at Trollhattan Falls the Swedish government has installed a plant of 155,000 horsepower. At Lake Ffully, in Switzerland, the remarkably high head of 5,413 feet is utilized. France, Germany, Norway, Sweden and Switzerland have each developed more than 1,000,000 horsepower.

In Asia, Japan, with 1,000,000 horsepower, and India, with only 150,000 horsepower, are the foremost countries in water-power development.

New Zealand has developed only 15,000 horsepower but is rapidly increasing this amount. Australia has practically no developed water power. The island of Pava has 56,000 horsepower developed or to be developed by plants under construction. Africa possesses only 11,000 horsepower of developed water power.

The total potential water power of the world is estimated at 439 million horsepower at low water, of which 62 million horsepower is in North America and 28 million in the United States. Africa is richest in undeveloped water power, with 190 million horsepower; Asia has 71 million horsepower, South America 54 million horsepower, and Europe 45 million horsepower.

The World Atlas of Commercial Geology, Part II, Water Power of the World, which has just been published by the United States geological survey, summarizes all present knowledge of that subject, mentions briefly some of the world's largest water power developments, and gives estimates by countries and by continents of the developed and undeveloped water power. It includes 37 pages of text and 10 maps and is sold for \$1.00 copy. Write to U. S. geological survey, Washington, D. C.

HONEY PRODUCERS ARE COOPERATING

Honey producers of the state, it is reported from the office of Deputy Market Director Britt, are reorganizing with signal success. The California Honey Producers' Cooperative Exchange, in units, is holding meetings at various centers of honey production and is gathering all possible force to carry the industry through the present and third year of existence, conceded to be the critical period.

The directors of the association include Watson W. Culver and Floyd M. Jeffner of San Diego; Willis Lynch,

Stockton; Reese Powell, Riverside; Casper Houser, Sacramento; Myron H. Wells and Royal G. Wilke, Los Angeles.

Honey production of 1922, it is predicted by those who know, will more than double that of last year. Hundreds of carloads are already contracted to be shipped through the Panama to Great Britain and continental Europe.

MARKET RADIO NEWS SERVICE

Market news reports on livestock, fruits, vegetables, grain, and dairy products are now being broadcasted daily from the Post Office Department's wireless station at Washington, D. C., and can be received within a radius of approximately 600 miles. The territory covered includes nearly all the states east of the Mississippi. It is reported also that the messages have been heard in Texas.

At 12:30 p. m. a report is broadcasted giving the day's receipts of cattle, calves, hogs and sheep at the ten principal livestock markets throughout the country and also a brief message pertaining to the opening of the Chicago and St. Louis hog markets. A complete report of conditions and prices in the Chicago and St. Louis livestock markets is sent at 2:30 p. m., and the prices of fruits and vegetables in the ten principal consuming markets, at 3:30. A dairy products report of the New York City and Chicago markets is sent at 5:00 p. m., and at 5:30, a press dispatch on the Chicago grain market. At 7:30 in the evening a complete report on the Chicago grain market giving closing, future and cash grain prices, and also a summary of the Chicago livestock market and Eastern wholesalers' fresh meat market, is broadcasted. At 8:00 p. m. a report is sent giving complete quotations on fruits and vegetables in the leading consuming markets.

Each morning at 10:30 a radiophone report is broadcasted showing the price retailers pay wholesalers for fruits and vegetables in the Washington market. This report can be heard within a radius of 100 miles or more.

The establishment of this schedule extends the chain necessary to enable the agricultural interests in all parts of the United States to obtain daily information of conditions and prices of agricultural products in the leading markets of the country.

BEST CONDITION OF FRUIT FOR STORAGE

The most satisfactory condition of maturity of fruit for storage purposes is the condition known as "firm-ripe," which is the same condition which has been found most satisfactory for shipping. This fact has been determined by investigations carried on with peaches, pears and avocados in particular by E. L. Overholser, assistant professor of pomology at the University of California agricultural experiment station.

Striking differences have appeared between different varieties of these fruits in regard to the length of time in which they will keep in storage. Some varieties of plums can be kept until November, others can be stored but a few days. Apricots in general cannot be kept so long, the maximum time being two months for one variety, while most varieties cannot be held more than one or two weeks.

Tests for the most satisfactory temperatures for keeping pears show that pears harvested in the proper condition at maturity can be kept at 30 to 32 degrees Fahrenheit. When prematurely picked, however, a more satisfactory temperature is 36 degrees Fahrenheit, which allows ripening to take place. Avocados have been found to keep best at about 40 degrees Fahrenheit.

QUALIFYING

"So this applicant for the bookkeeper's job claims he is a college man?" asked the bank president, addressing his clerk. "Has he anything to back up that claim? Can he qualify?"

The clerk stepped to the door and returned.

"The young man says," he reported, "that with your kind permission he will come in and give the college yell." —American Legion Weekly.

JERSEY BREEDERS

The California Jersey breeders held their semi-annual meeting at the University Farm during the annual Stockmen's Week and the meeting was attended by 35 enthusiastic Jersey breeders. The meeting was addressed by Frank B. Astroth, field representative of the American Jersey Cattle Club, Ivan H. Loughary, secretary of the Oregon Jersey Cattle Club and B. H. Rawl, educational director of the California Central Creameries. All of the speakers emphasized the importance of more official testing and the need of taking up the accredited herd work in California, leading up to the eradication of tuberculosis. During the course of the meeting the breeders instructed the secretary to take up the matter of accredited herd work with Dr. Iverson, of the state department of agriculture, and urged that he do all he could to expedite the accredited herd plan. The various breeders present signifying their desire to immediately take up the accredited herd work were: D. F. Conant, Modesto, M. Fortini, Orland, Judge Peter J. Shields, Sacramento, C. A. Arvedson, College City, H. McComas, Modesto, N. H. Locke & Co., Lockeford, A. J. Cooper, Chowchilla, W. J. Hackett, Ceres, J. H. Sawyer, Galt.

It developed that there was a very great demand for Jersey heifers and cows within the state and plans for bringing stuff in from outside of the state were discussed. The Jersey breeders are very anxious to have more cattle and will get back of any plan which has for its purpose the bringing in of desirable "she-stuff."

The breeders present felt after due consideration that the fees for official testing should be reduced and a committee consisting of Guy H. Miller, D. F. Conant and J. W. Coppini, was appointed to interview the authorities in charge of official testing within the state.

GRAZING FEES IN INSTALLMENTS

Requirements that grazing fees on stock using national forest ranges be paid 30 days in advance were waived by Secretary Wallace, permitting the payment of fees this year in two installments. Under new regulations payment must be made on or before the date stock enters national forests and on or before December 1, 1922, without interest on the deferred amount.

In 1921 more than 38,000 livestock owners grazed 2,129,500 cattle and horses and 7,455,600 sheep and goats in the national forests of the western states.

BERKSHIRE ANNUAL

The annual meeting of the Southwestern Berkshire Congress was held in connection with the national congress at Riverside last week. Officers elected for the coming year are: President, F. L. Hall, Perris; vice-president,

C. T. Johns, Cucamonga; secretary, George A. Stingle, El Monte. Others elected on the directorate were: R. A. Condee, Chino; D. J. Bastanbury, La Habra; Robert S. Jones, Etiwanda; Alex. Wilson, Guasti.

McCormick-Deering Harvester-Threshers

FARMERS of the West who face the hiring of big threshing crews and securing of extra teams and wagons for the grain harvest will make a big saving with a McCormick-Deering Harvester-Thresher. These practical machines have thoroughly demonstrated their ability to cut, thresh, clean and sack grain in one operation. One machine can harvest from twenty to twenty-five acres a day. No twine is needed, no shocking or hauling of shocks, no big threshing crews. More grain is saved and the straw is left on the field to fertilize the soil.

From eight to twelve horses or one Titan 10-20 tractor will pull a harvester-thresher. Two men can run it, one on the driver's seat and one on the bagging platform. This year a new 12-ft. machine is placed on the market. A 3-ft. extension, for use where conditions permit, may be had at extra cost with the 9-ft. or 12-ft. harvester-thresher. For stationary threshing a feeder and rake stacker are furnished at extra cost. The canopy top for bagging platform, as shown above, is regular equipment. Tractor hitch also regular.

Our descriptive booklet gives complete information on this labor-saving machine. Write for it to our branch house in any of the cities named below.

The Byron Jackson Deepwell Turbine

In big business

Great public service corporations are possible only because their operations are scientifically carried on.

Economy—that is the economy of a long period of time—is the basis of every move.

Which accounts for the general preference given to Byron Jackson pumps by such corporations.

Whether the pump is to deliver 50 or 200,000 gallons per minute, true economy and dependability are the governing factors in Byron Jackson construction.

Gas Does It Quickly and Well

In a year like the present when rains are seasonable and sometimes unseasonable, it is necessary to do an immense amount of work in a short time as soon as the soil can be handled. That is, it is necessary to do it quickly if the soil is to be available for crops during the present season. Hence there is demand for power which can be driven to the limit in hours and in load. The increased area of seed bed preparation made possible through use of the tractor is a valuable consideration. Ten hours a day does not tire it for when that time has passed a new driver may press the button and with aid of electric lights keep the machine going through the night. The tractor has made a place for itself which will broaden as the years go by.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTE

The photograph on the cover this week is strong argument for economical farm operation. Where one can attach two or more implements to one tractor and leave the seed bed ready for the planting or perhaps, as is often done, prepare the seed bed and drill in the seed at the same operation, there certainly is farm efficiency. Especially in a delayed season such as this it is necessary to have equipment that will make it possible to do the work in double quick time and do it right.

It takes \$71 worth of labor each year to support a cow. How much butter does the cow give in return for that labor? Lots of farmers can't answer that question.

CENSOR OUR WORDS

Speaking of farm loans, Secretary Wallace called attention to the advantage which some farm loan companies are taking of farmers. He said:

"One of the matters which I shall present to the conference is the thoroughly selfish and grasping attitude of many companies of different sorts

which loan money on farm mortgages. Large numbers of farm mortgages are coming due and must be renewed. Large numbers of farmers whose lands are not mortgaged are finding it necessary to mortgage them to raise money to pay floating debts which they can not meet in any other way. The farmers will have a hard time to get through this crop season and maintain their production. In view of this it is discouraging to note that many companies and individuals who are in the business of loaning money on farm mortgages are taking advantage of the farmers' distress to heartlessly extort a rate of interest and terms of loan which can not be justified. The farmer is being compelled to pay six, six and a half and seven per cent on five and ten year loans, without optional payments, and to these high interest rates a commission of five or six and in some cases as high as ten per cent is being added. Also many companies are cutting down the amount they loan per acre to the lowest possible point, thus restricting the farmers' credit at the very time when it should be expanded as far as may be done safely.

"There is no better security than a conservative loan on a producing farm, and such loans should be made at a relatively low rate of interest. No one should find fault with such restrictions as may be dictated by sound business prudence, nor should any one object to a fair interest rate, determined not by the temporary distress of the borrower but by the probable loan value of money during the next five years. But in this time of national stress one finds it necessary to rigidly censor his own words when speaking of some of the practices being followed by altogether too many companies and individuals engaged in the farm mortgage business."

? ? ?

Here is a question from a stock man which we are unable to answer. It is an honest, square question of a man willing to do his share if he only has a fighting chance. The inquirer lives in Santa Cruz County. Here is his letter entire:

"I will appreciate it very much if you will give me your candid opinion as to the future prospects of the beef cattle and hog business. Would you consider as a good investment a ranch of about 1400 acres, of which 500 acres are tillable, the remainder in pasture with oak timber, partly stocked, with necessary buildings, tools and equipment? I have had some experience in stock raising but don't know as to the future of the industry."

Unfortunately a candid opinion, expressed even because of widest observation, is of little real value these days of reconstruction. Conditions are different from those obtaining in any previous period of the world's history, and when we look at marketing, transportation and other conditions our first impulse is to say "Don't." But we recall that at the time Abraham Lincoln was assassinated and, though the war was practically over, the outlook was most serious and one of our greatest statesmen, in an effort to give at least a word of encouragement, remarked, "God reigns and the government at Washington still lives." General conditions today are vastly better than at that moment, though from a financial standpoint the outlook for the farmer is even bluer than in those days following the Civil War. Rural economists assert that "Low prices for farm products and high prices for manufactured goods represent an abnormal condition which cannot last."

Their deductions are made because of comparison of population and production figures for every year of the present century:

"The economists consider 1899 the starting point of their inquiry and represent the population, the farm production and the factory production of that year with 100 percent. Increases thereafter are indicated by 'index numbers, such as 103 or 124, meaning that there has been a jump of 3 or of 24 per cent, as the case may be. By 1903 population stood at 108, farm output at 105 and manufactures at 125. In 1907, population had still further advanced beyond food production, 117 as compared to 112, and factory output had raced ahead still further, to 156.

"In 1911 the figures stand 125, 117 and 158 respectively, and in 1914, when war broke out, population had increased 32 percent, farm products 35 percent and factory output 102 percent. In 1919, at the end of the war, the index figures read: population, 139, agriculture 138, manufactures 228. The economists contend that with food production just about keeping pace with population, while the supply of manufactured goods runs far ahead, farm prices in normal times will increase more rapidly than the price of the things factories can make. This, they say, held true in the first 15 years of the century, the normal 15 before the war, and it will hold true again."

That looks hopeful but we fear hardly gives the answer which will be most hopeful to our inquirer so we are going to pass the question along as we have many times before and ask our subscribers to unite in a bit of a conference as to whether a man can, under ordinarily favorable conditions, be justified in extending his farming operations. The same mail which brings the inquiry brings a communication from Mr. Spellmeyer as to encouraging the boys to enter upon a farming career. This discussion will be given in a later Cultivator and we ask transportation people and others to express themselves.

TO FIGHT OR NOT TO FIGHT

Many a California citrus grower is asking seriously as to the advisability of frost protection. He is not asking this for the first time for the question has been renewed repeatedly since the first citrus planting in California. It has already been answered by a great number of orchardists that it pays to heat the orchards. They have acted upon that belief, have thoroughly equipped and have succeeded, sometimes completely, sometimes only partially, in saving their crops. Again there have been others who have said that the obstacles, such as lack of capital, excessive cost, lack of ability to command labor at the exact instant it must be had to successfully fight frosts, are so great, and considering the fact that the severe frost only comes every half dozen or dozen years, they have decided to gamble on it—take their chances with the weather. Thus far the great majority of the citrus growers have been in the latter class, but as was the case after the freeze in 1913 and again in 1919 the present year's cold spell is creating renewed interest in orchard heating equipment.

If cost were not a consideration, there are now heaters so effective and provision for oil storage may be made so complete that with sufficient labor force immunity from frost damage may be secured, but with the better heaters ranging as high as \$7 and with some orchardists maintaining that there should be at least 100 heaters per acre to cope with cold as severe as that of this year it may be readily seen that the frost fighting equipment of a comparatively small orange grove calls for investment of a small fortune. So there are some

long thoughts on the part of orange and lemon growers.

This question has been taken up by the California Fruit Growers' Exchange, which has appointed committee from members of the board of directors. In addition a subcommittee has been named, connected with the Fruit Growers' Supply Company.

The question has been taken up by the Fruit Growers Supply Company the board of directors of which has appointed a committee to investigate as to whether a more satisfactory and economical heater may not be secured. The committee consists of W. K. Beattie of the Stewart Citrus Association; C. C. Teague of Limoneira Company, Santa Paula; H. A. Lynn of Riverside Arlington Heights Association; D. C. Cruikshank, La Verne Citrus Association; R. H. Wilkinson, Semi-Tropic Fruit Exchange; R. L. Willits, Queen Colony, Corona; R. L. Knox, San Antonio Exchange, Pomona; and J. D. Culbertson and H. E. Wallcott, committeemen at large. The formal report of this committee has been presented to the general board at its meeting this week and will be quoted from more largely in our next issue. In a word it has to do with standardization of heaters. Methods of work, handling of labor, cooperation with the weather bureau have been most thoroughly worked out in former years, but the really dependable heater to be had at a reasonable cost has been made a study by the committee. Mr. Hutchens, manager of the Supply, says that there will probably be no investigations or demonstrations along the lines of new methods. The idea will be to stick to California oil which has proven itself to be the best and most dependable fuel on earth and then secure the heater which delivers the maximum heat of the oil.

STANDARDIZING SERVICE

California has been a pioneer in fruit standardization. She has appreciated the value of reputation and tried earnestly to ship every box of fruit which would be equaled by every other box bearing the same brand or mark. She has succeeded. If not to perfection, she has achieved a great measure of commercial success. Diamond Brand, Sun-Maid or Sun-Kist and many other brands have arrived at the point where they are known to mean dependability. In line with this our county horticultural commissioners and the officers working under direction of the state department of agriculture have standardized or, perhaps more correctly, are standardizing, the service.

The federal department of agriculture is likewise rendering valuable aid, but we believe the department at Washington is rather more deliberate in breaking away from red tape and following new methods. The police service of the department has endeavored to prevent cull citrus fruits from being dumped in the eastern markets, and with this every grower is in harmony, but when the federal authorities make inspection of a car and then hold on siding for ten, sometimes possibly 15, days before releasing, it is rendering "service" which certainly lacks much of being standardized. The citrus league has a desire to aid the department in this matter of standardization and to that end has secured H. H. Warner of the state department of agriculture, who has gone to Washington and is representing the league in an effort to secure quicker release of perishable fruits.

WILL WORK WONDERS IN HARNESS

Cartoon used by permission of M. H. de Young of the San Francisco Chronicle.

Measurements of Colorado River Flow

THE development of the agricultural, water power and other resources and the construction of works to prevent floods in the drainage basin of the Colorado River offers problems of national and international as well as local and state interest, for the basin has an area of 244,000 square miles and includes parts of seven states and of Mexico. As all such development in the basin is primarily limited by the quantity of water available, reliable stream flow data, showing the total annual discharge of the river and its distribution through the year and through the drainage basin, are needed for the proper consideration of the problems involved, among which are the effect of the use of the water on the interests of the several states or of the United States, the location and design of hydraulic structures, and the administration and operation of hydraulic works.

A study of the information now on hand indicates that the principal needs can be met by accurate records of the flow of the river taken at 12 base gaging stations, six on the main river and six on the principal tributaries. In addition to these base stations secondary stations will doubt-

less be needed for the solution of special problems. The base stations on the main stream are Yuma, Topock, Boulder Canyon, Bright Angel, Lees Ferry and Cisco. The stations on the tributary streams are on the Green, San Juan, Little Colorado, Virgin, Williams and Gila.

For the purpose of coordinating stream gaging in the Colorado River basin and obtaining the data required, the United States geological survey proposes to cooperate with all those who are interested in the development of the basin in establishing and maintaining these base stations according to standards that will yield records of the highest type. These standards will require that the stations be equipped with water stage recorders and measurement cables.

In studying the water resources of the United States the geological survey maintains offices in 22 districts and three subdistricts. Four of these lie in part within the Colorado River drainage basin, as follows:

Arizona: Roger C. Rice, district engineer, 104 Agricultural Building, University of Arizona, Tucson, Arizona.

Colorado, Wyoming and New Mexico: Robert Follansbee, district engi-

(Continued on Page 290.)

Control the Colorado

The eyes of the Southwest are on the Colorado River Basin; the eyes of the nation are on the Southwest. Congress is considering some of our problems, rather, some of the problems which are nation wide in influence and which only congress can solve. It is due to ourselves, we of the Southwest, that we join in the campaign of education. Millions east of the Rockies have an idea that congress, in making appropriations or in advancing revolving funds for the development of the Southwest, is developing extreme sectionalism. Congress did not aid the settler in the valley of the Ohio in clearing off the beech and maple trees, so why should congress aid in reclaiming the desert? But as it exists today the desert is a liability of our nation. As it should exist tomorrow it will be a wonderful asset which will return thousands for hundreds spent in its reclamation. Statements can be made which will appeal to long headed business people of the East. We of the Southwest should pass on these statements. We should show wherein the reclamation of desert lands, the conserving of flood waters, the creation of hydro-electric power is a movement national in scope and national in benefits.

We are glad to give on this page an article furnished by the geological survey, touching upon some of the preliminary work which it has conducted for a period of years. The measurements made and data gathered are necessary before definite plans can be completed.

Besides, there is a statement made by Arnold Kruckman, secretary of the League of the Southwest, regarding some of the accomplishments and lack of accomplishments of the Colorado River Commission which is meeting with Herbert Hoover this week.

Again we make a limited extract from the Fall-Davis report which was presented to the United States senate by Secretary Fall on March 1. This report will certainly prove invaluable in convincing congress of the awful menace of the Colorado uncontrolled and the wonderful wealth of the Colorado reclaimed.

Agricultural News Notes of the Pacific Coast

Northern California

Large plantings of peaches are being made in Tehama County.

The accredited hatchery list in Sonoma County for March includes 15 names.

The new wool laboratory will soon be completed at the university farm at Davis.

An epidemic of coccidiosis among baby chicks in Sonoma County has alarmed poultrymen.

Directors of the Glenn-Colusa irrigation district have sent out water rates for the coming season.

Improvements are to be made on the Sonora-Tuolumne road that will eliminate the Buckhorn grade.

R. B. Eason, poultry specialist of the agricultural extension service, is making a survey in Sonoma County.

A sale of 30,000 bags of rice was made by the California Rice Growers Association at \$2.60 for No. 1 paddy.

Asparagus canners are reported offering 6 and 6½ cents a pound in the Rio Vista district of Solano County. Shipments are practically a month late this year.

R. L. Nougaret, in charge of the state viticultural service, is canvassing grape growing sections to learn probable requirements for cars in the shipping season.

Entries closed March 1 in the Sonoma County Apple Growers contest. The object of the contest is to determine best methods of culture to obtain quality and production.

Bodega-Valley Ford farm center has begun arrangements for a dairy cattle show to be held at Valley Ford the early part of June, jointly with Tomales farm center of Marin County.

The last right of way deed in the northern unit of the Santa Rosa-Schellville state highway has been signed and bids for construction will soon be invited by the highway commission.

The annual membership meeting of the Sonoma County farm bureau was held at Santa Rosa, February 22. President Walker of the state federation spoke on the agricultural conference at Washington.

At the request of Placer County growers E. O. Essig and W. P. Duruz of the university's deciduous experiment station at Mountain View will study control of peach twig borer in Placer County orchards.

The use of tobacco dust to fight bird and insect pests is urged by Horticultural Commissioner Bremner of Sonoma County who says that more than \$100,000 damage yearly is done by birds in eating off the new fruit buds in Sonoma County orchards.

Officers of Sonoma County farm bureau for 1922: president, Sheridan W. Baker, Santa Rosa; vice-president, John R. Denman, Petaluma; directors at large, Wm. Motle, Sebastopol; Arthur LeBaron, Valley Ford; C. E. Humbert, Cloverdale; E. O. Hussey, Cinnabar.

The California Cherry Growers Association has been conducting a membership drive in Alameda and San Joaquin Counties. Directors are: L. A. Frei and F. W. Maddock for Sonoma County; L. F. Coombs, Napa; A. B. Haslacher and C. Searles, San Joaquin; C. Long, Jr., Alameda.

Central California

Raisin Day this year will be held on April 29.

A Madera County dairy council was organized at Chowchilla recently.

The milk sugar plant is now in operation at Gustine, Merced County.

The Turlock Melon Growers' Association has elected its permanent board of directors.

Stockmen in the Coalinga section are planning to increase their herds because of splendid feed prospects.

Frank R. Brann, formerly deputy, is now horticultural commissioner of Tulare County, following retirement of C. C. Collins.

Early planted wheat in the Mariposa section has been held back by cold weather and heavy rains, but farmers expect record breaking crop.

Miller & Lux have won their injunction suit against the Madera irrigation district enjoining issuance of \$700,000 bonds for the Chowchilla project.

Farm center meetings in Kern County: Mountain View, March 20; Pond, 22; Inyokern, 23; Rosedale, 24; Shafter, 27; Arvin, 31; directors, Bakersfield, April 1.

Santa Cruz County recently secured the services of a home demonstration agent; now the women of Monterey County are asking that one be appointed for their county.

At a meeting of dairymen called at Salinas, Monterey County, by the state dairy council, a committee was appointed to make initial plans for the forming of a cow testing association.

A peach packing plant and a fig packing plant will be built at Dinuba by the California Peach & Fig Growers. Both are to be ready for the coming fruit season. They will be of concrete.

Over 97 per cent of the acreage in prunes and apricots in Tulare County is signed up with the Prune & Apricot Growers' Association. The Visalia plant of the association is in charge of R. J. Morehouse.

Farm home department meetings in Kern County: Committee, March 18; Edison-Fairfax, 20; Weed Patch, 21; Arvin, 22; Inyokern, 24; Rio Bravo, 27; Pond, 28; McFarland, 29; methods training class, 30.

Citrus growers of the Richgrove-Ducor district want a packing house and whether it will be at Richgrove or Ducor is to be decided by circulation of petitions to sign up at least 800 acres in the chosen district.

Dairymen of Merced and Stanislaus Counties met at Newman March 8. One of the main features was a judging contest of 12 cows with known milking records. Manager Greene of the dairy council was one of the speakers.

Officers of the Tulare Cooperative Poultry Association were reelected at the recent meeting of the board of directors, as follows: President, Elbert George; vice-president, R. H. Jones; treasurer and secretary, I. N. Foss; manager, I. N. Foss.

Officials of the Sun Maid Raisin Growers reelected for the coming year: president, Wylie M. Giffen; vice-presidents, Hector Burness and Frank H. Wilson; general manager; F. A. Seymour; treasurer, Milo L. Rowell; secretary and assistant manager, C. A. Murdoch; assistant secretary, R. B. Thompson.

Southern California

Palo Verde cantalope growers have formed an organization.

40,000 acres were planted to barley is estimate for Orange County.

Imperial County has chosen October 23-28 as dates for its fall fair.

A carload of Limas was sent last week from Hueneme for Near East Relief.

Large shipments of cotton are being made to Galveston and New Orleans from Calexico.

Cantaloupe and lettuce growers of Palo Verde Valley are going ahead with organization plans.

The Pomona chamber of commerce has voted to hold each fall an agricultural and horticultural fair.

Fifty dollar fines were imposed on two Hindus at Calipatra who had employed children in picking cotton.

Imperial Valley mourns the death of Charles R. Rockwood, who was chief engineer of the Imperial Irrigation District.

The Garden Grove Citrus Association of Orange County shipped out 242 cars of fruit this year as against 176 last year.

Associated chambers of commerce of Riverside County are making big plans for Dairy Day, April 8, at Riverside.

Perris, Riverside County, cotton growers will this year plant Acala instead of Durango. One thousand acres will be put in.

Contracts for the stretch of highway between Banning and Whitewater will be let this spring by the state highway commission.

Tractor school at Redlands, March 13-18. Carloads of grapefruit from the Oasis district are being packed and shipped from Thermal.

It is proposed to hold the annual Orange County automobile show with the Valencia orange show at Anaheim the latter part of May.

The Yucaipa farm center has chosen officers for the coming year: F. H. Gilmore, director; F. E. Dillon, vice-director; C. B. Rous, secretary.

E. D. McSweeney talked to potato growers of the Nuevo farm center of Riverside County at their last meeting on necessity of using best seed.

It is announced that the California Fruit Growers Exchange will delay until next year purchase of steamship line, owing to serious frost damage.

A campaign is going on for collection of \$30,000 to be spent in river protection work in the Yorba-Richfield-Anaheim district of Orange County.

Los Angeles County supervisors have instructed the county flood control engineer to proceed with preliminary survey of the San Gabriel dam project.

The Mohave irrigation district has started condemnation proceedings against the Arrowhead Reservoir and Power Company in its fight for waters of Arrowhead Lake.

The steamer Ohio sailed from Los Angeles harbor, March 6, loaded with food and clothing for Russian famine sufferers. Other shipments will be made from time to time.

E. G. Dezell who has been assistant manager of the California Fruit Growers Exchange has been named general manager to take the position left vacant by the death of G. H. Powell.

The Coast and General

Peaches grown in South Africa are on sale in New York.

Snow has been melting rapidly on ranges in northern Arizona.

Cotton planting in Arizona so far has been restricted to the Yuma section.

The next meeting of the Arizona Cattle Growers' Association will be held at Prescott in July.

The International Apple Shippers' Association will hold its annual convention at Seattle, Wash., July 26.

The Utah state prison at Salt Lake City has one of the first herds of Guernseys established in the state.

The agricultural bloc in congress has started definite attack on the proposal to pay soldier bonus by sales tax.

Hop growers of the Yakima Valley of Washington have formed an organization to study cultural and marketing conditions.

Colorado has a pure seed law. Tests are made at the seed laboratory at the Colorado Agricultural College at Fort Collins.

About half the cotton of the Salt River Valley of Arizona has been ginned. 77,000 bales is estimated as the total output.

The Colorado division of marketing says there is need in that state of an additional grade for potatoes between U. S. Grades No. 1 and No. 2.

Sheep raisers and others interested met in annual meeting at the Washington irrigation experiment station at Prosser, Washington, March 7.

Secretary of the Interior Fall has signed and forwarded to congress the Davis report on the Colorado River reclamation and flood control project.

Potato growers of Aroostook County, Maine, are petitioning the interstate commerce commission to extend to their crop the general freight reduction of 10 per cent.

Washington has quarantined against filbert stock from Montana, Colorado, Wyoming, New Mexico and eastern states in an endeavor to prevent filbert blight from entering the state.

Nine cars of certified seed potatoes of the Burbank and other varieties recently were shipped from the potato farm of Charles H. Greely at Pioneer, Washington to Watsonville, California.

A bill has been passed by the house and sent to the senate authorizing entrymen and owners under government constructed and operated projects to form irrigation districts under state laws.

Grays Harbor County, Washington, bankers at Aberdeen pledged the Holstein breeders of the county between \$12,000 and \$20,000 in long-term loans to finance immediate importation of at least 100 head of purebred dairy stock.

Early potatoes and asparagus are coming up in the Salt River Valley of Arizona, but crops there and in the Yuma Valley have been of slow development owing to low temperature. Alfalfa is looking well, but is not up to normal.

At the recent annual convention of the Arizona Cattle Growers' Association at Globe, Henry G. Boice was elected president and J. M. Ronstadt vice-president. A committee was appointed to work out consolidation plans between the Arizona Wool Growers' and Cattle Growers' Association.

Review of the Orange Situation

By F. W. Read, Chief Bureau of Standardization,
Department of Agriculture

THE department of agriculture feels that present legislation governing the shipment of frosted citrus fruits is inadequate, especially during the period immediately following a freeze and up to the time when the drying out standards established under the statute of 1915 can be applied. Mr. Hecke has already indicated that he will call a representative meeting of citrus fruit growers and shippers as soon as practicable with a view to requesting the industry to select a committee to draft a bill which can be presented to the coming session of the legislature, regulating the shipment of frozen oranges and other citrus fruits in a very definite and comprehensive manner. It is felt that the industry should take this means of instructing the state department of agriculture how they desire their problems to be handled so that there can never be any question in the future as to the right and wrong of any particular feature of an enforcement policy affecting shipments of frozen fruit. This is a constructive suggestion well worth the serious thought of every grower and shipper of oranges and lemons in the entire state.

Immediately following the freeze the department took such action as was possible to secure the opinion of interested growers and shippers concerning regulations governing the movement of frozen fruit. A mass meeting was held in the offices of the Los Angeles chamber of commerce on January 24 and at that time the proposed regulations, subsequently issued, were discussed at considerable length. These regulations were approved by

the growers and shippers present, representing over 90 per cent of the citrus fruit tonnage. In a number of subsequent mass meetings, two of which were called by the California Citrus League in Los Angeles, the regulations of the department were approved by a large majority vote. The last meeting at which the regulations of the department were endorsed was held on February 6 and was attended by between 400 and 500 prominent shippers and growers.

In the meantime the county horticultural commissioners, acting under the direction of the state department of agriculture, as provided by law, were inspecting every shipment of oranges leaving the state or consigned to points within the state. Opposition to the regulations was encountered and it was necessary to draw complaints directed against certain shippers. The first case to be considered came before the superior court in San Bernardino County on February 7. Judge Goodcell held that the department had no right to make a violation of rules and regulations issued under authority of the fruit and vegetable law, the subject of a misdemeanor charge. The court pointed out, however, that had the complaint been based on section ten of the fruit and vegetable act, namely, that oranges could not be shipped if frosted to such an extent as to endanger the reputation of the industry, the case would have been tried on its merits. Under the circumstances, however,

the state had no opportunity to present evidence tending to show whether the fruit in question was 5 per cent, 10 per cent or 100 per cent frozen. There has been so much misunderstanding as to the exact language and import of Judge Goodcell's decision that the following excerpt from the official court record giving his findings may be of interest: "I think everybody in the country should be imbued with a proper spirit to protect the citrus industry of this state from the incalculable injury which would follow from the shipment of frosted fruit. I think every fruit grower recognizes that the shipment of that kind of fruit will work an immense injury to the citrus fruit industry of this state, and I think that everybody should be pleased that the department of agriculture is doing everything it can under a piece of loosely constructed and illy considered piece of legislation to protect the citrus fruit industry of the state; but the only thing the court can do is to take the law that the legislature gives us, and doing that I do not think that the director of agriculture has a right to pass a regulation or a rule, the violation of which will be a crime; I do not think they have a right to maintain this criminal prosecution for a violation of those rules, and viewing the matter as it does, the court will direct that the writ of habeas corpus as prayed for in the petition be issued and the petitioner discharged."

If the decision of this particular

court is taken as authority, however, it opens a very serious question for the consideration of citrus fruit growers and shippers to the effect that there is no adequate legislation at the present time regulating shipments of oranges during the period immediately following a freeze and up to the time when the drying out standards can be applied. It is for this reason that the director of agriculture has suggested the appointment of a strong legislative committee to consider the matter, representing the citrus fruit industry.

It should be noted that the United States department of agriculture has for years issued rules and regulations interpreting and defining its attitude in the enforcement of many laws which are exceedingly general in language. The United States pure foods and drugs act, for instance, provides among other things that "food shall be deemed adulterated if it consists in whole or in part of a decomposed animal or vegetable substance." This is essentially the exact wording of the law, which, it will be seen, so far as that particular section is concerned, is very general in character. The secretary of agriculture then proceeds, in the case of oranges, to state that "citrus fruit shall be deemed inferior and decomposed within the meaning of the act if the contents of any package in interstate commerce contain 15 per cent or more of citrus fruit which on a transverse section through the center shows a marked drying in 20 per cent or more of the exposed pulp." This is a regulation of the department of agriculture, but of course

(Continued on Page 288.)

Rudiments of Fertilization

E. L. Koethen

WHILE the various elements are all needed for rounded plant development they each have a specific office to perform, and without a good balance the best results cannot be obtained. The specific office of nitrogen in plant life is to encourage growth, both of wood and fruit. A tree starved for lack of nitrogen will have small leaves, light green or yellow in color, and the wood growth will be short and slender.

Phosphoric acid is chiefly concerned in the production of fruit. We knew of an orchard that had been very heavily fertilized for a series of years with rich stable manure. For a time it produced phenomenal results, then crop failures came. The grower approached an experienced neighbor about it and was advised to apply steamed bone meal. The result was magical. The ranch had become phosphorus poor, and the bone meal supplied the lack.

Potash is supposed especially to strengthen the wood growth, it not being so brittle if sufficient potash is present in the soil.

Lime is needed as a corrective of soil evils, in addition to the fact that it is a necessary plant food. It goes into the structure of the plant and makes up a portion of its weight, but as a remedy for soggy and inert soil it is important. Without it the proper bacterial action cannot take place. Soil that is deficient in lime melts down and becomes solid and lacking in mellowness. In this respect its ac-

tion is similar to that of organic matter in the soil. While it helps to break down the organic materials and makes them more quickly available it also must be used in conjunction with other materials, as without other sources of plant food the soil soon becomes deficient in plant food, much sooner than it would without the additional lime. Some salesmen have told growers that lime was all the fertilizer the soil would need for the year that they applied lime. In their anxiety to get the profits from the sale of the lime they have led some growers astray, we fear. After the use of lime other fertilizers are more needed than ever. Limestone countries are known to be rich agricultural lands, and it is the practice in these countries to apply lime to the soils which are underlaid with lime, so that we may well inquire into our needs for liming.

The above elements are about all that are required for our consideration. In choosing what to apply the selection is not nearly as difficult as we have been led to believe. In fact, it is rather simple. We may determine at the outset that the nitrogen is the most deficient element. This is always needed and we are not likely to use too much at the present prices. Being the most expensive element it must first be considered. If it is purchased in organic form there is com-

paratively little loss if more should be applied at one time than is absolutely needed. Knowing the previous history of the orchard the grower can easily judge whether phosphorus is needed. It is a fact that analyses have shown that in the run-off of water only a trace of this element has been detected. So once in the soil it is there until used. But as it is a comparatively cheap element it is safe to apply a little more than is actually needed. For this reason it is customary to use a tankage running high or low in phosphorus as the grower may deem best at each application. We are of the opinion that an application of tankage containing about eight per cent of this element where the nitrogen runs about eight per cent, is nearly a balanced ration for the ranch at an application. This would be especially for the winter application. For the late spring or summer we would advise one running higher in phosphoric acid for the reason that it is not best to use large applications of nitrogen at that period unless necessary. This is in order to allow the trees to attain their growth and go to rest naturally in autumn.

As to the potash needed it is a question whether we need consider it at all. On some sandy and other soils it may be necessary, but on our granitic loams it is very questionable if it is needed.

As seen above, it would be well to

consider the use of lime from time to time. Then we have the situation about like this: Nitrogen in the form of humic materials especially. Plenty of humus making materials as a soil solvent. Phosphoric acid for luck and to insure results. With this exception, other considerations are only occasional. This seems to us a very simple program. The humus may be obtained from cover crop or manure or straw of some kind, preferably alfalfa or bean straw. Nitrogen additional from blood or tankage. Perhaps some inorganic nitrogen to stimulate the setting fruit. The complication comes in when we are about to make our purchases. Prices differ, sources differ. Trade preferences may determine our action. But we must remember that we have a fine fertilizer law that protects the grower in his purchases. When we buy we are pretty sure we are going to get what we pay for. There is little chance of substitution if we insist on the requirements of the law. It is true that some purchases have in the past been made from unlicensed houses. If you do this it is your lookout. The goods you buy from licensed houses are subject to state inspection at unexpected intervals, and this protects you. It was not always so. When the present fertilizer law went into operation there were several of the larger concerns that had to go out of business. Their sources of profit were gone. But we care little for that. We have no sympathy for a business that cannot stand the light of day.

A SEIBEL AIR SPRING SEAT on your tractor will free you from that bouncing, jolting, and constant swaying—will protect you from the danger of a permanently injured spine and serious kidney trouble—will make you feel 100% fresher at the end of the day.

Sent on 10 days' trial

Send \$18.50 to our nearest agency, or to the company direct, for a 10 days' trial. Pay the return freight if you don't want to keep the seat, and your money will be refunded.

MOVING OLD TREES

There is no age limit on moving trees. If proper care is taken any tree, even apple or peach, may safely be moved. The only question the mover should consider is: Will it pay? With fruit trees it is doubtless better to plant young trees than transplant those eight or ten years old. Still, the job is not hopeless or even doubtful as to results. In California we move magnolias and other large evergreen trees, of a half century of growth, with tons of earth. In eastern states large oaks and elms are easily moved during winter when soil is frozen in a solid mass.

To move deciduous fruit trees of large size the work should be done while they are most dormant, preferably during December and January; never after buds begin to swell. If soil is not full of water from rains soak it full two or three days before the moving. For an eight or ten year old tree dig a trench around tree, down below the root zone if possible, the inner side of which is not nearer than three feet to the trunk. Cut all roots with a sharp shovel, ax or pruning shears, being careful to look them over before replanting and make clean cuts with shears or saw on all cut ends. On the larger stubs it may be as well to paint or wax them. With a garden fork or other tool dig away soil from ends of roots toward trunk, equally on all sides, stopping when ball is small enough so it may conveniently be moved with tree. As the most important part of transplanting lies in solidifying soil close to trunk it is better not to dig away this important anchorage zone if it can be moved with tree. Have the hole for new set dug before digging out tree and see that it is amply large. It is a good plan to loosen soil deeply in bottom of hole so surplus water may not remain stagnant about roots. When replacing soil pulverize it well, leaving no large lumps, tramp it down solidly but do not tread on roots, and soak heavily several times with water.

BIG PEACH ORCHARD

The planting of what is said to be the world's largest peach orchard will be completed within two weeks by the Rio Oso Fruit Company, whose president is Freeman B. Mills, Tokay grape grower of Lodi. Mr. Mills is the secretary of the California Fruit Exchange and a fruit grower of many years' experience. About 600 acres will be planted this year to cling peaches and 300 more next spring. This is part of the 7,000 acres of Natomas lands sold by the Sandercock Land Company to the California Hemp Industries and resold by the Hemp Company to Mr. Mills and associates. This land was purchased a month and a half ago and the Rio Oso Fruit Company immediately put nine big tractors to work in clearing brush, trees, plowing and leveling.

About 1,500 trees are being planted each day and over 404,000 will be planted this season.

SUTTER CLINGS

Sutter County now claims to be the real for sure cling peach county of the state. Commissioner Harry Stabler has made some investigations and reported to his board of supervisors. From his report it is noted that the total of cling peaches set out in December, January and February was 2,209 acres, making 10,000 acres a conservative estimate as the planting in the county. February saw 87,293 cling trees, or 873 acres, planted.

Sutter County in five years in average seasons will have a production of cling peaches that will require 25 canneries of the capacity of the plant now operating in Yuba City to handle it. This local cannery in one season usually cans 3,700 tons of peaches.

DEHYDRATION OF PRUNES A SUCCESS

Dehydration of prunes is a success, declares A. W. Christie, assistant professor of fruit products at the University of California agricultural experiment station. Of the dehydrated prunes delivered to the Prune and Apricot Growers' Association in 1921, 95 per cent were of the first quality. Dehydration has proved to be as cheap as sun drying and often produces a superior product. It has been found also that dehydrated prunes can be as

easily processed in the packing houses as sun dried prunes. In addition to prunes, experiments have been made by Professor Christie, in cooperation with commercial firms, on berries, apricots, peaches, pears, apples and pumpkin. In many cases the results of these investigations have been applied commercially with marked success. Rapid expansion of the dehydrating industry in California is predicted.

CARE OF TUB PLANTS

Owners of tub plants of considerable size are urged not to hold them many years with the expectation of continued health and vigor, even with the best of care. Careful attention to watering and fertilization will prolong the days of presentable appearance, but the method is at best faulty.

One should remember that the greater the leaf surface the greater the transpiration and exhaustion of sap supply. The latter is dependent on the area of its root penetration and supply of soil moisture and this is necessarily much restricted in tubs, boxes or other receptacles. If so held for a considerable time leaf reduction and impairment of vigor are natural results. Therefore move annually to larger holders or plant in garden and refill boxes with younger plants.

Dry Land Planting

Fruits Which Require Little
or No Irrigation

ALMONDS—This is a fine time to plant because trees are cheap and planters are neglecting almonds this season. This will result in high markets by the time the trees begin bearing.

Montgomery Ward & Co.

The Oldest Mail Order House is to-day the most progressive —

1872

THE first little one-page mail order leaflets were sent out by Montgomery Ward & Co. in 1872. The first catalogue, pictured above, was issued in 1874. It contained eight pages, about three by five inches in size. This was the beginning of the mail order business—of selling goods direct by mail at one small profit.

1922

FIFTY years of fair dealing, of prices that always offered a saving, and today this big Golden Jubilee Catalogue contains everything for the Home, the Farm and the Family—everything at money-saving prices.

50th Anniversary

This big Golden Jubilee Catalogue pictured above is priced to match the spirit of the times. Some things are priced at no profit, many things at very little profit. It is your best guide to the lowest prices.

THIS is the Golden Anniversary of Montgomery Ward & Co. We have completed Fifty Years in the service of the American Public.

In 1872 this business was begun in one small room, twelve by fourteen feet.

Today, millions buy from us on faith in the name: "Montgomery Ward."

Upon what is that faith founded? Upon Fifty Years of fair dealing, upon Fifty Years devoted to selling only goods of standard quality at the lowest possible prices.

This 50th Anniversary Catalogue keeps faith with our customers. It is priced to meet present-day conditions. It is filled with new, fresh merchandise with every price based upon the new low costs of production.

Some things at No Profit Many things at Little Profit

At Montgomery Ward & Co. we believe we owe a duty to our customers—that it is our duty to sell everything today at the lowest possible prices.

We believe we owe a duty to the American Farmer. Therefore, we are selling *all our Tillage Tools absolutely without profit to us.*

Many of these tools are actually priced at less than it would cost us to replace them today. This is the way we are keeping faith with the American Farmer.

And to the American Woman we are offering almost equal advantages—New York Fashions, selected in New York by Ward's own Fashion Experts. All are offered at the lowest prices possible today.

Everything needed in the home—everything to make the home more attractive—everything priced at a big saving for you.

The New-Old Spirit of Montgomery Ward & Co.

We are entering our second half century of business existence. And we step forward with the spirit of youth, of progress in Service and Saving for you.

To give you bigger and bigger values, to give you better and still better service, to quote always lower and lower prices—that is our work and our accomplishment today.

Buy from this 50th Anniversary Catalogue. Know that the price you pay is the right price for whatever you buy. Know that every order you send, every letter you write, will be handled in the full spirit of the Golden Rule.

If you have a copy of our 50th Anniversary Catalogue, lend it to your friends.

REVIEW OF THE ORANGE SITUATION

(Continued from Page 285.)

In the case of alleged violations the federal government for years has based complaint upon violation of the pure food and drugs act itself. In other words, the procedure of the United States government in the matter of frozen oranges has been for years exactly the same as that of the state department of agriculture during the past month or more.

It has been erroneously alleged that the state inspectors were not trained citrus fruit men. The inspectors of the state department of agriculture are chosen on the basis of their practical knowledge for the work in which they are to be engaged. The state supervising inspector in Southern California is an expert citrus fruit man, has been in complete charge of an orange packing house, knows the citrus fruit industry and its problems and has a sympathy and appreciation for the grower which has tempered the entire enforcement policy. The

same might be said of the other inspectors employed by the state, and I feel certain that the county inspectors as a group are as practical, as sympathetic, as efficient as any similar group of enforcing officials to be found anywhere in the United States.

It has been stated by some shippers that fruit which county and state inspectors rejected and which was actually moved to market sold at very high prices, thus proving that the inspection service was unsound and that the regulations were faulty. Such conclusions are hastily drawn and do not represent the facts. It is true that a few shippers who have not cooperated have been able to forward and sell badly damaged fruit at good prices because the industry generally has supported the enforcement officials. The prices received are undoubtedly accounted for in part, at least, by the fact that many of the markets of the country were comparatively bare of fruit at the time these shipments reached their destination. Moreover, a good price paid by the carlot receiver does not always indicate that

the ultimate consumer has received good oranges. The citrus fruit industry can only be protected by stimulating the right attitude on the part of the consumer. A permanently satisfied customer is worth more than a temporary profit realized on an individual shipment.

It is now known that a number of shipments made in the face of protest by the county and state inspectors to points even within the state and showing no evidence of frost injury except the characteristic water soaked appearance of the segment walls and the presence of crystals were subsequently condemned by state officials at destination on the basis of the drying out standards. Interstate shipments of the same character have also been condemned by the United States bureau of chemistry.

In a calamity as great as this one has been differences of opinion are bound to arise and there will always be groups of individuals on the one side who believe the lines have been drawn too sharply and similar groups on the other side who believe that

the regulations are not strict enough. It is the primary function of the state department of agriculture to serve the interests of the growers and producers, and while it is undoubtedly true that some shipments of merchantable fruit have been delayed by the standards enforced nobody was able to suggest any test or group of tests more applicable to the situation than those actually promulgated by the department and which would allow this merchantable fruit to go forward while still preventing the shipment of badly damaged oranges.

The present standards being used by the state department of agriculture and the county horticultural commissioners are those found in the statute of 1915, providing that no oranges shall be moved to market if the fruit in boxes or in bulk, or if the contents of any package contains 15 per cent or more of citrus fruits which on a transverse section through the center shows a marked drying in 20 per cent or more of the exposed pulp. These standards will permit the shipment of all fruit that is really merchantable, and it is my firm belief that any delay in moving merchantable fruit occasioned by the regulations of the department has been more than compensated by the maintenance of the markets through stopping a rush of badly damaged oranges to Eastern and Middle Western centers of distribution. Such a rush of fruit could only have demoralized the situation and would indeed have occasioned irreparable injury to the growers and to the citrus industry.

It would indeed be unfortunate if nothing constructive came from the experience of this freeze. The suggestion to appoint a thoroughly representative committee to draft adequate legislation for the future is a thought which will be put into action. In addition, a test trip to New York City with a car of oranges showing characteristic frost injury has already been arranged with a view to determining such important questions as rapidity of drying out and the actual condition of the fruit at destination. Practical citrus men know that the crystalline deposit and the water soaked appearance of the segment walls is in a season such as this one a positive indication of frost damage before drying out or evaporation sets in. This test trip made under average transportation conditions will prove this fact to all. The trip is being undertaken by the United States bureau of markets and crop estimates and is another indication that constructive results will be forthcoming from the experiences of the past several weeks. It is quite possible that the standards adopted were not perfect, but no one was able at the meetings held by the department and by the Citrus League to suggest anything better. I feel that the policy pursued was the most intelligent possible in view of all the circumstances and it is my judgment that had the department of agriculture and the county horticultural commissioners not maintained a thorough inspection of the oranges offered for shipment a repetition of the disastrous experiences of 1913 would have been the inevitable result.

NURSERYMEN CONFER

A meeting of the executive committee of the state nurserymen's association was held in Los Angeles, March 3, to confer with state and county horticultural officials regarding existing quarantine and inspection laws. Those present were: President Barnicott, Newcastle; Secretary Grady, Donald McLaren, Hans Plath, San Francisco; E. W. Horton, Fresno; Max J. Crow, Gilroy; J. S. Armstrong, Ontario; Roy F. Wilcox, Montebello; Fred H. Howard, chairman, Los Angeles. The state was represented by Director G. H. Mecke, Harry S. Smith, Fred Brosius, Sacramento; C. H. Vary, Los Angeles; A. P. Messenger, San Pedro. The county commissioners were: A. H. Call, Ventura; H. J. Ryan, Los Angeles, and Inspectors Edouard and Bittel of Mr. Ryan's staff.

After the points of difference of opinion were freely discussed, a committee was appointed to meet and formulate a program and plan of action to lay the matter before the state agricultural legislative committee. This joint committee consists, for the nursery interests, of the legislation committee: J. E. Bergtholdt, chairman, Newcastle; Daniel Mac-

In answer to the question, Who owns the P G & E?

Col. Good and Neighbors own this Big Company

COLONEL GOOD and Citizen Thrifty—together with fifty thousand other people, mostly Californians—own the securities of the P. G. and E.

This information may astonish some who have imagined that public utility concerns were owned by caged-in, austere-looking plutocrats.

But genial Colonel Good, the kindly, sympathetic old friend of the family—who dares to call him a cold and calculating person? And Merchant Square, or Judge Right—they are your neighbors. No more honorable, fair-minded fellows ever lived. Yet they are also partners in this big concern.

Some way the whole thing looks different, doesn't it, when one realizes that the millions of dollars invested in this huge Company are only the accumulated small sums of individuals who have clubbed together to build an enterprise so needed for the industrial advancement of the state?

This "public partnership" arrangement is a source of pride with the officials of this Company.

The Pacific Gas and Electric Company is the property of thousands of people. And everyone is invited to take shares in it.

Rorie, San Francisco; E. B. Wash- burn, Pasadena. The state will be rep- resented by Harry S. Smith and Fred Brosius, the county horticultural commissioners by their president, H. J. Ryan, Los Angeles. At present deal- ers may ship by freight or express and shipments are inspected at desti- nation. But when they ship by mail to obscure points the postmaster re- mails parcel to nearest postoffice where there is an inspector, it is opened, repacked and remailed to original destination. The consignee is required to pay additional postage on each mail movement. Packages are sometimes carelessly repacked by in- spectors, which, together with time consumed, may result in death of plants. The control is under a ruling by the postmaster general and subject to acceptance by the state.

CHAYOTE CULTURE

The chayote (Sechium edule) is a vegetable rapidly gaining in public favor and is now on sale by all seeds- men and at fruit stalls and groceries. The root is perennial and fairly hardy; the top is cut down by hard frosts or dries and withers in favored spots. As the plant is a rampant climber it is well to provide ample range in the way of trellis, fence or arbor. It makes a fine summer cover for the latter.

Though the chayote will grow in any soil it does best in rich, well drained sandy loam. If land is low and drainage poor, plant on ridges as is done for sweet potatoes. The en- tire fruit is planted, for, though it be- longs to the melon-squash family, it has but one seed, a large one; the only member of a large and variable family with but one seed. Plant with the big or seed end covered with not more than two inches of soil and let the smaller end stick out of soil. Cul- tivate deeply at first but when roots develop they are close to surface and light cultivation and mulching is best, otherwise frequent waterings are ad- vised. If field culture is practiced the plants are grown ten or 12 feet apart each way and given a large T-shaped trellis to clamber over.

The chayote is a vigorous grower and a hungry feeder and will consume large quantities of animal manures or commercial fertilizers. Rather more potash is required than for the aver- age truck crop. The better practice is to use barnyard manure in general and wood ashes around each plant. The latter furnishes both potash and lime. The fruits should be allowed to remain on vines until fully mature but not until they begin to sprout a new vine. Wrapped in paper separately, packed in excelsior and put in a cool place, they are excellent keepers. Chayotes are not especially subject to pests or diseases but occasionally have the same troubles as cucumbers and melons.

PROTECT YOUR PEACHES

"Peach growers should profit by last year's experience when thousands of dollars worth of their fruit was lost throughout the state by being infested with larvae of the peach moth and now prepare to spray thoroughly and prop- erly for the control of this pest," says Theo. D. Urbahns of the bureau of pest control, state department of agri- culture.

Among others, even experienced peach growers had difficulty in con- trolling this pest last season with the old established control methods. The lime-sulphur, 1-10, has given good control for the average grower during the average season. We also know that there is a chance of poor appli- cation and the past spraying season was followed by heavy rains. Some growers used the dry lime-sulphur in solutions too weak for effective work.

For the present season at least let us stay with the standard control for the peach moth and peach leaf curl by spraying thoroughly with lime- sulphur when the buds start to swell. If it rains immediately after the spray- ing, spray again.

Save the surface and
you save all—Fuller's

Floors—
Refinish Yours Yourself
with paint or varnish—We tell how

IT'S a simple matter, if you cannot get a painter to refinish your farm house floors yourself.

Fuller's Floor Paints are the finest finishes and last the longest. They dry over night so you can walk on them in the morning.

They are made for the amateur's use as well as the painter's—they flow evenly, spread well, and do not streak. The result is a smooth and lustrous finish.

Women can apply these floor paints as well as men.

Fuller makes a special paint for every purpose and our Rubber Ce- ment Floor Paint is especially adapt- able for farm house floors.

Two popular varnishes—"Fuller- wear," the Spar Varnish for every purpose, will not mar, scratch white or turn white when hot dishes and hot water come in contact with it. Use "Fullerwear" for any varnish- able surface.

"Fifteen-for-Floors" Varnish, a high gloss varnish, extremely trans- parent, which will give your floors that desired, well-kept appearance.

We also make a special line of paints, varnishes, enamels, etc., for all kinds of interior decorating. We specialize in these materials and methods after 72 years' experience with paints and painting practice.

We are one of the largest paint manufacturers in the United States.

Why Our House Paints
Are Good

Fuller House Paints are made from the best materials—pure PIONEER WHITE LEAD, pure linseed oil, zinc and color in scientifically exact proportions, arrived at through many years of manufacture.

Our process super-puri- fies and "whitens" the lead base. It must be fine enough to pass through a silk screen with 40,000 meshes to the square inch. A fine lead means easier spreading and more elas- tic, tougher protective coat.

If properly applied, such house paints will last five or more times as long as cheap paint, and looks better through the years.

Fuller's

KIRKMAN NURSERIES

This Orchard Yields an Average Income of Six Hundred Dollars per Acre

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

OUR EXPERIENCE

has been gained through thirty-two years of progression in the nursery and orchard business in California.

WE OFFER OUR SERVICES

in undertaking the planting and care of commercial orchards for prospective owners desiring a profitable orchard or vineyard without undertaking the improvement work. We will furnish the land and bring it into bearing under the guarantee that it will be PROFITABLE, or ALL MONEY invested will be returned to the customer with interest. The payments made by customers constitute a first lien on each subdivision tract. If every property becomes highly profitable as we plan all customers will take deed. If for any reason some of them should prove to be only fairly remunerative the customer has not taken a greater hazard than to make a safe real estate loan.

We have been growing orchards for others in conjunction with our nursery business for several years. ALL of these have been profitable to our customers. We are now in a position to serve those interested in high class income properties to the best advantage. Lands already secured for this purpose are situated at strategic locations on or very near paved highways and the very best of soils that can be secured regardless of cost. We now have growing or in the course of improvement a total of sixteen hundred acres, including considerable plantings of Thompson Seedless, Malaga, Emperor and Muscat Vines, also canning and drying peaches, apricots, plums, prunes and figs, including one of the finest young Kadota orchards in the state. These plantings are in Kern, Tulare, Madera, Contra Costa and Merced Counties, adjacent to thriving towns, modern schools, etc. We are willing to put our money in with our customer's and safeguard him against any possibility of a loss. Our part of the investment and our profit comes out of the crops of the properties. Details and location of properties on application.

TREES AND VINES

for everybody. Send for our descriptive price catalog.

MEASUREMENT OF FLOW OF COLORADO RIVER

(Continued from Page 283.)

neer, 403 Postoffice Building, Denver, Colorado.

Utah and Nevada: A. B. Purton, district engineer, 313 Federal Building, Salt Lake City, Utah.

California: H. D. McGlashan, district engineer, 328 Custom House, San Francisco (suboffice, 602 Federal Building, Los Angeles).

The larger part of the work required in connection with the base stations mentioned above will be done in the Arizona district.

The principal users of stream flow records at present are the United States government (represented by the reclamation service, the federal power commission, the weather bureau, the national park service, the geological survey and the Colorado River commission), the states in which the drainage area lies, the local water users, and the permittees, licensees and applicants for permits or licenses under the federal power commission.

The geological survey can furnish, in addition to records of stream flow, many topographic maps, geologic reports and other data that have a direct bearing upon the solution of the problems of the Colorado River drainage basin. These data may be obtained from the director, U. S. Geological Survey, Washington, District of Columbia, or from the district engineers in the basin, named above.

A LOOK AT THE REPORT

THESE are great days for the Southwest. We are all dreaming dreams and trying to visualize the Southwest of the future, and we are hoping congress will, as now appears because of recommendations of Secretary Fall, Arthur P. Davis and others, take action which will mean a great step in the development of the Southwest. If the recommendations of Director Davis' report are followed it will mean safety for Imperial Valley first and irrigation water, cheap power and development for vast numbers of other acres in the seven Southwest states.

A few of the recommendations submitted to Secretary Fall by Director Davis of the reclamation service follow:

"It is recommended that through suitable exchange the United States undertake the construction with government funds of a high line canal from Laguna Dam to the Imperial Valley to be reimbursed by the lands benefited.

"It is recommended that the public lands that can be reclaimed by such works be reserved for settlement by ex-service men under conditions securing actual settlement and cultivation.

"It is recommended that through suitable exchange the United States undertake the construction with government funds of a reservoir at or near Boulder Canyon in the lower Colorado River to be reimbursed from leasing the power privileges incident thereto.

"It is recommended that any state interested in this development shall have the right at its election to contribute an equitable part of the cost of the construction of the reservoir and receive for its contribution a proportionate share of power at cost to be determined by the secretary of the interior.

"It is recommended that the secretary of the interior be empowered after full hearing of all concerned to allot the various applicants their due proportion of the power privileges and to allocate the cost and benefits of this high line.

"It is recommended that every development hereafter authorized to be undertaken on the Colorado River by federal action or otherwise be required in both construction and operation to give priority of right and use:

"To river regulation and flood control.

"To use of storage water for irrigation.

"To development of power."

SOME JOB UP TO THE COMMISSION

THE Colorado River Commission is meeting in Phoenix this week. Presumably Secretary Hoover called this meeting in the heart of the Colorado Basin so that all the communities deeply concerned in this development of the Southwest might be there and present their interests. Regarding this meeting and some of the problems before the commission and action, or rather lack of action, by the committee, Secretary Arnold Kruckman of the League of the Southwest writes:

Chairman Hoover represents the federal government on this commission. He brings his exceptional abilities as engineer, financier, administrator and publicist to function upon the problems of the Colorado River on behalf of all the people of the United States. As secretary of the department of commerce he is a direct contact between the people of the Southwest and the president. Naturally, therefore, on this occasion Secretary Hoover will seek to ascertain the wishes, desires, aspirations and viewpoints of all the people in all the states in all parts of the Colorado Basin. Consequently, it seems imperative that every community or interest directly or indirectly or remotely affected by the proposed projects on the Colorado River shall be competently and substantially represented at the impending meeting.

The Colorado River Commission was created jointly by the federal government and the seven states of the Colorado Basin. Its function is to formulate the terms upon which a compact may be made to divide the waters of the Colorado River among the states at interest. Eventually its conclusions will be submitted for action to the congress of the United States and to the legislatures of the seven states.

It is reported that at the initial meeting recently held in Washington

each commissioner presented an approximate estimate of undeveloped acreage upon which his state based its claim for unappropriated Colorado River water. Particularly conspicuous were the following estimates: Colorado, 1,800,000 acres; New Mexico, 1,400,000 acres; Utah, 1,000,000 acres; Nevada, 82,000 acres. The estimates of Wyoming, Arizona and California were modest and closely followed the estimates made by Director Arthur P. Davis of the United States reclamation service in his various recent reports.

It was also proposed that the states above Boulder Canyon limit their program of development for a period of 20 years.

There appears, however, to have been wide divergence in the views of the several commissioners. Colorado, for instance, holds that it has complete sovereignty over all water originating within its boundaries. Other states, contrariwise, hold with the federal government that all unappropriated waters of interstate streams, like unappropriated public lands, belong to the people of the United States. It appeared also that several commissioners were not adequately equipped with data or information to enable them to participate in any affirmative declaration of the broadest nature.

After five strenuous days developed apparently irreconcilable differences concerning principles, quantities and time, the commissioner from Wyoming offered a broad minded formula, negative in regard to facts or figures, but affirmative in endorsing the broad principle of the proposed development of the resources of the Colorado River. The commissioners from Colorado and Utah declared they were unable to support even such a formula without further consulting their principals at home. Therefore, naturally, the chairman had no choice but to bring the meeting to a close.

The implication of what transpired at Washington is clear. It is essential that all communities and interests in all states of the Colorado Basin send authoritative and influential representatives to the meeting at Phoenix, Arizona, on March 15. The commissioner from each state should have immediately available the counsel and cooperation of his most competent constituents.

It is obvious much of the immediate as well as future progress and prosperity of the Southwest depends upon the conclusions reached by this commission. It is urgent that every community alertly and watchfully follow its proceedings.

CONTROL MEALY BUGS

Methods of controlling mealy bugs on pear trees have been developed by Prof. E. O. Essig. He has found that successful results can be obtained by removing the outer rugged bark very carefully, particularly on Winter Nelis trees. This should be followed by two or three thorough applications of miscible oil or crude carbolic acid spray before the buds begin to swell. In case of very serious infestation the spraying should be followed during the early development of the fruit by the application of plain water in order to kill as many of the newly hatched insects as possible.

The crude carbolic acid spray will give thoroughly satisfactory results at a very much less cost than the proprietary materials. It can be made as follows: Dissolve 40 pounds whale oil soap in 25 to 30 gallons hot water. Add five gallons crude carbolic acid and five or ten gallons spray distillate. Stir thoroughly. Add water to make 50 gallons. Bring to a boil and stir for 20 minutes. For use, dilute one part of this stock solution with 20 parts of water.

NEW BLACKBERRY PEST

Methods of controlling a new blackberry pest, the blister mite, are being investigated by E. O. Essig, associate professor of entomology of the University of California agricultural experiment station. This new pest is attacking and causing great damage to Himalaya blackberries in the Santa Clara Valley. It attacks the blossoms and developing berries, causing deformation, abortion and uneven ripening. For the present, recommendations for control consist in winter, spring and summer applications of weak solutions of commercial lime-sulphur and wettable sulphurs.

Did you ever try Grape-Nuts with stewed prunes or peaches?

THERE isn't anything better for breakfast or lunch than a dish of Grape-Nuts, with cream or milk, and stewed prunes or peaches.

This delicious combination gives you the elements of a well-balanced food. For it contains not only the material needed to build tissue and furnish energy, but it also supplies fruit acids, that help keep the system in good order.

Go to your grocer today and order a package of delicious Grape-Nuts. You will find that it will digest more readily than most other cereals, and it will "stay by" you longer—because it's so richly nourishing.

Whitewash Protects From Sunscald

HE current issue of the Los Angeles County Farm Bureau Monthly gives resume of Prof. J. C. Whitten's recommendations for whitewashing young trees to prevent sunscald. From it we quote:

The trunks of trees should be whitewashed as soon as planted to prevent sunscald and drying out of the buds and growing layer. Whitewashing should be kept up each winter for the first three to five years after the young trees are planted. Exposed trunks or bare main limbs of older trees are also protected from sun blister if kept whitewashed.

Sunscald is more severe in winter even though the injury may not be noticeable until summer. The coloring matter in the bark of trees absorbs enough of the sun's rays on sunny days to raise the temperature of the growing layer to from 25 to 35 degrees above the temperature of the air. This renders the cells of the growing layer and buds, especially on the sunny side of the tree, turgid, active and tender.

As the sun goes down at night the temperature of the tree falls promptly to the temperature of the air, which may be freezing or even below. This

fluctuation injures the growing layer and buds.

Whitewash reflects the sun's rays, keeping the tree at, or a little below, atmospheric temperature. This keeps the tissues of the tree dormant, even during the sunny days, preventing injury when the temperature drops gradually at night.

A study of the temperature of trunks and twigs during summer shows that the upward passage of cool water from the roots and its evaporation from the twigs and leaves cools the parts of the tree above ground. During the hot, dry days of summer the trunks and twigs are usually cooled to from 15 to 20 degrees below the temperature of the air. This is more marked adjacent to green leaves which evaporate much water and least marked on long, bare trunks and main limbs which have no twigs and leaves to evaporate the water. This emphasizes the desirability of preserving rosettes of leaves and short fruiting twigs all up and down the trunks and main limbs to shade and cool the parts where sunscald usually occurs, also of low headed trees. These leaves also digest plant food to nourish the limbs, trunks and roots,

maintaining a thicker, healthier annual ring of new sap wood.

If sunscald begins on the south side of the trunk and main limbs in winter it can continue during the summer. Winter sunscald dries out the tissues and opposes the development of sapwood and green leafy twigs on the exposed parts. Cool sap is not readily carried through these dried and injured parts so they are less cooled during hot summer days.

A good whitewash which will stick may be made as follows: Slack 15

pounds lime in 2 pounds salt. Sift 3 pounds sulphur while lime is slacking. The heat of the slacking lime acts on the salt and sulphur so as to form a wash that will stick. Add water to make a thick whitewash and apply to tree trunks by means of a spray pump or a brush.

Whitewashing the trunks of young trees or sunscalded parts of older trees is desirable, especially in winter. It is not necessary on older trees with thick bark and which have twigs that shade the limbs.

The Walnut in Northern California

By Leonard Coates

HERE are several problems relating to the walnut industry in Northern California that remain unsolved, among them being root stocks, method of culture, and varieties. Offering an opinion as to the first, I would say that the assumption that the native black walnut is the one and only stock on which the cultivated varieties should be budded or grafted is a mistake, just as much so as if it were asserted that the peach is the only stock for the prune, the apricot for the apricot, and so on.

In other words, soils and moisture conditions vary as much if applied to the walnut as to other fruits. The black walnut stock had its inning, of course, and won out on the strength of its resistance to the oak-root fungus.

The mature walnut orchards of Southern California and the more or less isolated walnut trees and avenues in Northern California that were planted 20 or more years ago are presumably all either seedlings or grafted on seedlings of their own species. To the casual observer nothing is wrong with these trees under ordinary good treatment. In orchards of more recent date there are frequently some trees on native black walnut root and some on their own root. Invariably, if the soil is heavy, the latter are the better trees. In some cases which I could point out those trees on their own root are almost double the size of the others of same age.

In France only seedlings of their own kind are used, and, according to Prof. Howard, oak root fungus is abundant. Moreover, I saw these walnut trees planted under very extreme conditions: some in black bottom soils, kept moist by flowing streams; others high up the mountain side. Seedlings there are often trained to 10 or 12 feet before being grafted in the orchard, the trunk being wrapped with rye stalks or other material to prevent injury by frost or sun. As the trees become too old for profit from nuts they are cut down and the long, straight trunks used for billiard cues, gun stocks, etc. I saw whole trainloads of such logs.

The point is, why throw completely into the discard the *Juglans regia* as a stock? It certainly is better in some soils than *P. nigra*, and the ravages of oak root fungus seem very slight to warrant such condemnation. Where this disease is known to exist by all means use the most resistant stock, but not, necessarily, where the fungus is not prevalent.

Methods of propagation and culture vary greatly, each man's way seeming right in his own eyes. A grower showed me over his walnut orchard, mainly top grafted on black walnut but reserved inspection of his finest trees until the last. He had no use for nursery trees, top-working was the only way, etc. But the "finest trees" were nursery trees grafted in the usual way! The black walnut is advocated, and with reason, as the harder stock to top-work and which will stand the more abuse. On the other hand, where spring frosts prevail, or sometimes occur, the early flowing sap of *J. nigra* starts growth sooner than if Franquette or Mayette or Serotina seedling were used. I have seen some orchards—not very extensive ones—grafted so high that a 16 foot ladder was necessary to reach the first branches; others, much more numerous, branched two or three feet from the ground. The walnut tree may not need cutting back except to shape it, but the average tree certainly requires a great deal more thinning out.

Walnut orchards are spaced all the way from 25 to 60 feet apart with or without permanent inter-cropping. Is either extreme desirable, and with all varieties, on all soils?

Franquette grows upright, Mayette tries to reach the ground, Payne makes a small, compact tree, Concord a medium between these. They require different spacing as well as different pruning.

The varieties best suited to Northern California are undoubtedly of the Mayette and Franquette types, and those growers and nurserymen who

This Truck Builds Profits—and Adds to the Pleasure in Farming

TO MAKE large savings in the time and cost of farm hauling, a motor truck must be ready for use right when it is needed. From the first step in design and manufacture, **International Motor Trucks** are built with this requirement in mind. They are sturdy and dependable in every part, from the four-cylinder, block-cast engine to the hub caps.

But our interest in your International truck goes still further. When some part needs replacement or adjustment, the unequalled International after-sale service is at your command. You can always depend on your International being ready for work.

There is a size and style for your requirements. Capacities range from the 1,500-pound Speed Truck to the 10,000-pound truck for heavy duty. Body types include grain-tight boxes, hay racks, stock racks, panel delivery bodies and many others.

Ask the International Motor Truck dealer nearest you for complete information, or write us.

will devote some time and land to the experiment by planting some selected seedlings and noting results will occasionally stumble upon something of superior merit. There are several already having deservedly local reputations but which may need still further testing under different conditions to determine their full value. Climatic conditions in Lake county very much resemble those about Tonlins, in the Grenoble district, and the walnut industry there is becoming important. A large proportion of the nuts shipped graded Jumbos.

The more one sees of California, the more one is impressed with the knowledge of her marvelous food production possibilities and real development, but just beginning, as it were.

AVOCADO VALUES
By Ernest Brauntorr

Avocados must be regarded from two distinct points of view by Californians. It is quite certain that the chief point of value to the consumer is flavor. It is equally certain that the grower's chief consideration is keeping quality. With the increasing acreage and yield our fruits must find a market at least as far east as Chicago and Mississippi River points.

Unless the consumers like the flavor of avocados they will not eat them. Some people do not like oily fruits of any kind. With the olive: Some eat them every day, others do not eat them at all, though having "sampled" them a hundred times or more over a range of years. Many have tried avocados by the score and never found one with a flavor that pleased. Therefore flavor will dominate retailing of the fruit. "Oil content" is a point the average consumer cares little about. Keeping is of little importance to the buyer for home use, as he is in the "consuming" business and doubtless wishes to eat the fruit as soon as possible. All fruits sell on appearances and the best "lookers" will catch the most coin. Neither the size of the fruit nor relative size of seed will be much considered by the average consumer.

On the other hand, the grower must look to his market and it matters little where that market is. The fruits must keep until sold, whether at San Francisco or Los Angeles, Kansas City or Chicago. Just as good keeping qualities are required for profitable handling in home markets as for shipping under refrigeration, for at home the fruits are much handled and exposed to high temperatures and therefore deteriorate more rapidly than in transit eastward. These considerations are going to have a heavy bearing on planting in the days to come. Even today the best posted contemplating planter is scratching his dome of thought and asking himself (and others) "What varieties shall I plant?"

CANNED SALAD

The big plant of the California Co-operative Canneries at San Jose has been the scene of considerable activity recently, where, under direction of the superintendent, Walter Holmes, a considerable force has been engaged in the packing of fruit salad. This product is made up of various fruits which are packed in the cannery during the regular fruit season and which are now being assembled, or rather mixed together, carefully under a selected formula, producing a very delicious table salad. This appeals to the housewife in that it greatly lightens the work in the home and gives her a fruit salad which contains all of the delicious California fruits.

This is the second run on this product which the growers' cannery has made. A previous pack was quickly taken by the trade, resulting in large repeat orders. It is anticipated that the demand for this product will very greatly increase and eventually result in the cannery operating during a considerable part of the period when ordinarily there is no work available.

Generally speaking, raspberries will not stand very hot or dry weather. Blackberries can endure hot weather, but not hot drying winds. Dewberries are grown mostly in the warmer parts of the country. In very cold sections the plants of these fruits should receive some kind of winter protection.

GRAFTING DECIDUOUS TREES
By Ernest Brauntorr

ARM ADVISER HODGSON has recently been holding a ten day series of field meets on top grafting deciduous trees. After a short talk Mr. Hodgson demonstrates in the orchard the most approved methods of top working by cleft grafting.

"There are several reasons for top working. In newly planted districts much of the planting has been testing to see what varieties are best for local conditions, for market, etc. It is amazing to see the number of orchard planters who do not investigate market conditions before planting and so set many of the wrong varieties to meet local demand. Even tastes vary, as in the egg market; New York demands white eggs while Boston will have none but brown. The planting of right varieties should be the first consideration.

"Sterility is another reason for top working. Many trees are either self sterile or partially so, and a poor set of fruit results through lack of cross

pollination. Japanese varietles of plums are nearly all self sterile, also some cherries, apples, and occasionally pears. Some cases are known of peaches partially self sterile. Heath Cling always bears best next varieties that bloom at same time. In planting or top working every ninth tree is sufficient. Some orchardists so handle every third tree in every third row. Determine what varieties you need to help you. Eastern or European plums do not cross pollinate with the Japanese. Of the latter Satsuma is the most deficient, though the best plum for local markets. There seems to be two strains of Satsuma; one is poor, the other good. A close second to Satsuma in the local market is the Santa Rosa, a good early plum. Climax is a good pollinizer though some years rather late.

"Walnut growers are doing much top working. Nearly all the older walnut orchards are largely seedlings and at least one-fourth have been found to be 'boarders' or not self supporting, and top working is almost imperative. The citrus grower was the pioneer in top grafting to in-

crease yield. This change may be made at almost any time of the year but now is as favorable as any season. Saw off to stubs, split the top and insert grafts. Later bark grafting is done, wherein the wood is not split. Still later we may safely bud. Remember that in this work the cambium layer is everything. To properly contact the cambiums of the scion and stock, to hold them there and keep air excluded spells success. There is some after care, of course, the chief of which is rewaxing as vulnerable parts are exposed."

When space is available a section of the garden may be set aside for the permanent vegetables and the small fruits. The location of these permanent crops, however, should be such that they will not interfere with the plowing of the garden or the cultivation of the annual vegetables. In no case should the small fruits be crowded, it being best to plant a limited number, selecting those best adapted to the region.

REO

SPEED WAGON

Canopy Express
\$ 1435

Chassis only—\$1245

Experience with more than 60,000 Reo Speed Wagons now in service, proves that the range of adaptability of this wonderful truck covers every class of hauling and delivering where loads vary from 500 to 2500 pounds—"a quarter-ton to a ton-and-a-quarter."

It is equally true that Speed Wagons are better suited to all kinds of carrying on farms ranging from five acres to fifty thousand acres in extent.

Through all the range of agricultural activities—the general farm, and the highly specialized grain, or dairy, stock, or fruit farm—this Speed Wagon runs the gamut of service.

Seems as if its versatility is unlimited. No rival has ever been able to cope with Reo Speed Wagons in all kinds and classes of carrying. They dominate the field regardless of carrying capacities, and do the work quicker, better and cheaper.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sugar Beets Go to Seed

Appreciating the difficulties of answering your questions so that all conditions may be covered, I nevertheless wish to call attention to your answer concerning the development of seed stalks on sugar beets if planted in September and left in the ground over the winter, or rainy season. (See Cultivator, February 25, 1922, p. 210.) The Beaumont subscriber had good grounds for his query, and while your answer may be correct according to general theory, or in ideal climatic conditions, it is contrary to the facts as I have observed them for interior valley conditions. In the Salt River Valley of Arizona, in southern Nevada, in the San Joaquin Valley and in the Sacramento Valley, sugar beets display a marked tendency to develop seed stalks if planted in the fall or winter months — even February planted beets, if they encounter a cold spell sufficient to induce a semi-dormant condition, frequently show a marked tendency along this line. Perhaps your answer is correct for conditions where the weather never gets cold enough to induce a semi-dormant condition, but for 12 years I have noticed that beets in their growing habits are governed by conditions favoring continuous growth (when they behave as true biennials should) or if cold of winter or heat and scarcity of water in summer check their growth and a new growing period is induced by later and more favorable conditions they ignore the "date book" and proceed to behave as though they thought their temporary sleep had made them a year older. When these seed stalks are permitted to grow unchecked the value of the beet for stock feed or for sugar manufacturing purposes is greatly impaired as the stored sugar of the root is replaced largely by crude fibre. But if the seed stalks are persistently removed the beet retains more value for the purpose for which it has been grown.—O. W. Jarvis, Farm Adviser for the Sacramento-San Joaquin Bank, Sacramento.

Cutting Trees to Kill

I would like to know when is the best time to cut trees and keep the stump from sprouting.—Subscriber, Templeton.

That depends upon the variety. There was at one time an impression that if one should cut evergreen trees in the fall when they could form no more green leaves until spring and cut the deciduous trees just as they were coming into full leaf in the spring the shock would kill them. This was generally true "back east," but here in perpetual summerland and with the eucalyptus tree one may cut any time of the year and still find that the stumps are sending up sprouts and before the first year rolls around have made sufficient growth for another sizable tree. The best way to eradicate tree and stump is to grub out. However, ordinarily if one cuts the tree at any convenient season then watches for suckers around the stump and grubs these out with mattock—if taken early enough they may be rubbed off with the fingers—and if this is continued persistently the stump will soon die.

Care of Rabbits

Do you have literature on raising and care of rabbits for markets?—Subscriber, Orange.

W. D. White, one of the most successful rabbit producers in California, is now preparing an article for the Cultivator on rabbits, varieties, housing, and general care. In addition there is published the "Rabbit Book," which may be had for \$2 net by writing J. B. Lippincott Company, Philadelphia, Pennsylvania.

Walnut Grafting—Seed Planting

I saw in recent issue of the Cultivator how to graft old walnut trees, but that didn't quite touch what I wished to know. I have a quantity of black walnuts, nice large ones from

the northern part of the state. I want to plant one lot to these for nursery stock. I planted three rows a month ago. The soil being sandy it stays moist but not wet, and not a one has sprouted. I planted about six inches deep. Do you think they will sprout in time. I had one sack that was out in the rains and stayed wet all the time and I discovered these were sprouting so I planted them about four or six inches deep. Is that too deep? How wet should they be kept? Now I would like to know something about grafting young trees. Is there a government bulletin on grafting? If so, where can I secure one?—Subscriber, Pasadena.

Apparently you planted the seed rather deep, and it may be a long time before the ground will warm up so they will start. The usual method would be more as you treated those in the sacks, keeping wet and warm, or better, stratify in sand which is kept moist. Then as the little sprouts start they are carefully placed in nursery row. As to grafting, there have been complete directions given in former Cultivators by Mr. Roeding and others. See California Cultivator, pages 289 and 291, Vol. XLII, also page 121 of Vol. XVIII, the present one, article by Mr. Neff. "The California Walnut," published by the California Walnut Growers' Association, contains a fund of information, as does Bulletin 332, "Walnut Culture in California," by L. D. Batchelor. This may be had by writing College of Agriculture, Berkeley.

Planting Eucalyptus Trees

What is the best month to transplant eucalyptus trees?—Subscriber, Holtville.

Method often followed in planting eucalyptus trees is to sow seed in flat in a soil consisting of leaf mould and coarse sand. After soil is leveled sow the seed and give light covering of sand over the top and keep moist. This may be done in August and then in March or April the little trees are taken out and put in pots for later planting in the open. If they are where they can be given a little attention when the hot days of June come they may be planted in their permanent location. Write State Board of Forestry, Sacramento, and ask for "Handbook for Eucalyptus Planters," also to the University of California, Berkeley, and ask for "Eucalyptus in California," Bulletin 196.

Eradicating Weevil

How do the bulk grain farmers combat the grain weevil? We have a concrete granary, 4,000 sack, and the weevils get very thick each spring. We have done nothing to kill them as we feed to steers and the barley does not seem to be injured.—Subscriber, Chico.

The best treatment is thorough fumigation of the warehouse or storage bin with hydrocyanic acid gas. Work with this gas, however, should be in the hands of those who understand it, or if handled by a novice thorough attention should be given to the details of the operation. Full information is given in the pest fighting number of the California Cultivator of September 24, 1921. In a word, it consists of stopping up cracks and making warehouse as nearly airtight as possible, after which it is fumigated with cyanide of sodium, 1 ounce; sulphuric acid, 1½ ounces; water, 2 fluid ounces, for every 100 cubic feet of space.

Grafting Pecans

We have two seedling pecan trees that are eight years old and have never borne. Would you advise grafting budded nuts to these trees, and if so where could one get the scions for grafting and what time of the year should the work be done?—Subscriber, San Gabriel.

The pecan is very easily grafted and another month will perhaps be the right time for grafting. The scions should, however, be secured at once and kept in moist sand until needed. We know of no large commercial plantings in California yet but practically every nursery, especially those

which are advertising in the columns of the Cultivator, can supply the scions.

Chrysanthemums

Your paper has been a help to me in my garden many times. I noted article on chrysanthemums some time ago but cannot determine why mine did not do well last season. The year before they were extremely nice so last year I gave them double care, hoping for even better results. Some of the blossoms matured in the center and the outer petals were small and shriveled, while some others only matured on one side. I transplanted them very carefully, put plenty of fertilizer on them, watered well once a week. Can you tell me why they were not right?—Subscriber.

While this trouble may be due to three or four causes it is most marked in plants infested with red spider. This is, however, an inexcusable condition, if known, for water sprayed with considerable force on the parts of the plants affected will quickly reduce their numbers and chrysanthemums will stand all the water you wish to apply. The pest should be eradicated before buds begin to open or the flowers may be seriously affected and it is most difficult to eliminate the spider after flowers are open.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Learning Sale Price

How can I ascertain the correct data as to the price obtained on a sale of land by parties acting under powers of attorney?—Subscriber, Lathrop.

About the only way to obtain this is to learn it from the parties who were concerned in the sale as the deeds usually are made for ten dollar consideration. The agent should, of course, return the correct price, but there is no method other than a suit to learn it from a legal standpoint.

Selling Uncalled for Stock

In case of sale of uncalled for pasture stock must an attorney be employed to give the advertisement in any particular form? How many times must the advertisement be published? Who conducts the sale? Is it recorded?—Subscriber, Ben Hur.

Only one notice of sale need be given, ten days previous to date of sale. The owner of the pasture or any other person may conduct it. No record is required. As to drawing notice there is no particular form required, but it would be well to have someone advise you with regard to sale, as if there is any fault in connection with it you might be held liable for the value of the stock, for the reason that if the sale is not properly conducted it is void.

Survey of Boundary Line

Can my neighbor proceed to move his fence when at his own request he has employed a surveyor to run the line and the surveyor makes a new line some 40 feet on my property? The old line has generally been recognized for 20 years, and buildings have been erected which will be affected by the change. The surveyor referred me to a recent case authorizing his mode of survey.—Subscriber.

The mere fact that a private surveyor claims that by a new method which he has adopted the line runs elsewhere than heretofore by no means makes it so. In order to enable your neighbor to move his fence against your will it would be necessary for him to have this new survey backed up by the judgment of the court. The case referred to is one concerning township surveys wherein fractional sections appear. It was there held in effect that where in a survey of public land there has been no return of a line run in the field dividing a fractional quarter section into halves and no corner common to the east and west halves fixed at any point along the boundary line of such

quarter and the field notes show that a continuous unbroken line was run from the southeast to the southwest corners of the quarter sections, it is the duty of the surveyor general in drawing a line on the plat dividing such quarter section into east and west halves to run the line through the quarter section north and south from a point on the boundary line equidistant from the southeast and southwest corners of the quarter section. A deed to the east half of a fractional quarter section of land which makes no mention of acreage conveys the east half in quantity or the division of a quarter section under the rule as to government surveyors divides the quarter into halves of equal quantity or acreage.

Sale of Estate

Three heirs have equal shares in house and lot. Two desire to buy the third party's share but are unwilling to pay the third party's price. Can they force a sale by court at the appraised price of the property?—Subscriber, Fresno.

The parties in this case are tenants in common and as such any one of them may make a petition to the court for partition of the property. In this case referees are appointed and when it is found that the land can not be allotted among the respective parties an order may be made for the sale of the property. This sale is made by the referees at either public or private sale as the court may determine best. The referees after the sale make a report to the court, and the court may thereupon confirm the same. The valuation at which the property was appraised in probate proceedings is of course not binding because it may have either risen or sunk in value since that time.

Life Estate

Under a will the wife is made the sole legatee during her lifetime. No provision is made, however, for a sale of the real estate. If such real estate becomes burdensome to manage could the legatee sell? There are minor children.—Subscriber, Hughson.

If in the probate of the estate dis-

tribution has not been made the executor of the will could make a petition to the court, showing that it is for the advantage, benefit and best interest of the estate that the real estate, or some part thereof, be sold, in which instance the matter would come up for hearing and any objections which there might be would be considered and the court would make its decree. If the estate has been distributed the sale might also be effected by a petition to the court in the matter of the estate of the minor children. In such instance a guardian would necessarily be appointed and it would probably be necessary to appoint someone other than the mother. This is assuming that the widow has a life estate and the fee title to the property is vested in the minor children. A similar proceeding as before stated could be taken and the court would determine then whether or no it is for the best interest of the estate to make a sale of the property and would make its order in accordance therewith.

The New Model F
Cletrac
Reg. U.S. Pat. Off.
**TANK-TYPE
TRACTOR**

\$675

Delivered in California

*Unbeatable for
Orchard work*

Hard this way, but—

Easy on a track—
The Cletrac Way

1. Handles every farm job.
2. Plows 6 to 8 acres a day using any 2-bottom 12-inch plow.
3. Every part subject to wear constructed of chromesteel—weighs only 1820 lbs.
4. Automatically lubricated—no grease or oil cups.
5. Simple, care-free design—burns kerosene, distillate or gasoline.
6. Every working part quickly accessible.
7. Unprecedented value at \$875 complete.

Model "F" Cletrac is made in four sizes: 31 inches wide, with 8 inch clearance; 41 inches wide, with either 8, 14, or 18 inch clearance.

The "impossible" has been done! A tractor that is unbeatable for orchard work in addition to handling all other farm jobs, including all kinds of cultivating, has been developed!

With a complete range of usefulness for all farm work—with a price that is right in line with the demand of the hour—Cletrac F will actually make you figure the use of tractor power all over again.

Cletrac F does all your orchard plowing and cultivating, using the tools that you have on hand at present. It is low set and compact—works right up close to the trees without scraping bark or branches. Its remarkable short-turn ability allows it to swing from one row into the next with a single twist of the wheel. In addition—Cletrac F does all the regular farm jobs outside the orchard, including row-crop cultivation.

Its capacity for work is enormous—plows 6 to 8 acres a day—discs 15 to 20—harrows 20 to 25—and withal it is so simple, care-free and accessible. Equipped with a sturdy, powerful 4-cylinder kerosene, distillate or gasoline burning motor.

See your local Cletrac dealer or write our nearest office for full information.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

SONGS IN THE NIGHT

Last night I waked to some unwonted voice—
'Twas liquid melody I heard;
The night was dark, the midnight hour
was past
When came the carol of a bird.

From out the covert of a clinging vine
Not far below my window seat,
The softest, sweetest, rippling serenade
Arose my wakened ears to greet.

'Twas sung to cheer the heart of sitting mate,
The mocking bird upon her nest,
And while the waning moon was over-
head
These notes with love were manifest.

The silence of the early morning hours
Gave deeper impress to the song;
'Twas like a tender voice of sympathy
An exhortation to be strong!

I sometimes wonder if the song to which
I listened with such keen delight
Was sent to show me that my waiting
soul
Should sing its praises in the night!—
Frederick M. Steele in L. A. Times.

A TRUE BIRD STORY

NOT long ago a friend told me of an experience he once had with a mother Humming bird and her nest. How many of you have ever seen a Humming bird's nest in its natural place? It is one of the rare things to find.

The mother Humming bird in the story built her nest in a low apple tree, just outside my friend's window. He could look right into it. It was such a tiny nest of plant down, cobwebs, and lichens, and so nearly the color of the branch on which it rested that it was hard to see, even when one knew just where to look. Soon there were two small white eggs in the nest. They hatched into tiny, helpless baby birds, that at once began to eat and grow. The mother had a very curious way of feeding her little ones. She would fly away in search of food—sweet nectar from her favorite flowers in garden and orchard, and a host of tiny insects. These she swallowed. Back she would come to the nest, and, putting her bill into that of one young bird, would raise some of the food from her own crop and so give the baby its meal. Then it would be the other's turn.

As time went on the little birds grew to be as large as bumblebees, and were covered with a fine black down. One day the mother bird did not come back after she left in the morning. She did not come at noon. At night she was still away. The little ones were very hungry. My friend did not know what to do, but finally he cut the branch off some distance below the nest and took the whole thing over to a nearby store, where he was working. He carefully hung in up out of reach of cats, or rats, or mice. Next he opened a jar of extracted honey. He put a little of the honey into his mouth to mix it with saliva. Then he took a toothpick and drop by drop let the honey fall into the open mouths. So the baby Humming birds had their supper. The next morning they had breakfast in the same way.

About noon the second day my friend learned that the mother bird was back again and nearly wild because she could not find her nest or her babies. What could he do now? The branch was cut off and was hanging over in the store. Could he give the bird her nest again? He decided to try, anyway. So he went and got the nest and a piece of stout twine. It needed great care not to spill out the little birds, who all this time had lived safely in the nest, and had not been touched. He lapped the cut ends of the branch together and bound them tightly. Then he went inside to watch.

The mother bird was troubled. There was her nest and in it were her babies. But something was different. What was that strange bump? She would hop along the branch to within a few inches of the cut place, but she would not cross it to the nest. All that long afternoon she took to gain courage enough to cross the binding. But at evening she fed her babies once more. After that she raised them without any more trouble until they left the nest themselves.

Is not that an interesting story? I

think it is the most interesting bird story I have ever heard. I know that it is true, because I know my friend would not lie, even to make a good story. Where could the mother Humming bird have been that day when she stayed away from her nest? I think we may be sure that she did not stay away of her own accord. Something must have kept her. Once I knew of a boy who caught a Humming bird and kept it in a fruit jar all of one day. He did not hurt it, nor did he mean to hurt it. At night he let it go again. But perhaps that bird had a nest, too. Perhaps something like that happened to the bird in our story. At any rate, it makes us think that we may be breaking up homes when we capture the wild things and hold them, even for a few hours. Most times it is better to leave them free, and to study them that way all we can.—Rural New Yorker.

A CAT WHO WORKS IN A RESTAURANT

While his name does not appear on the payroll, he takes his job seriously and Mr. Fuller, the owner of the restaurant, treats him as one worthy of his hire.

Tom has unusual accomplishments and Mr. Fuller estimates that up to the time of his arrival in the restaurant, he lost not less than \$200 from the destruction of foodstuffs by rats, mice and cockroaches. In addition to that, he spent not less than \$100 a year on rat traps, roach powders and the constant expense of trying to construct something which would guard the foodstuffs from these pests. Tom had been on the job only a few days when there was not a rat, mouse or cockroach to be found on the premises. At this rate Tom has already been worth to his owner \$2,700. He also performs the same service at the Fuller home.

Tom is also the only known cat that has been trained to deliver messages. Mr. Fuller frequently writes a note to his wife, ties it around the cat's neck and in due time it is delivered at the Fuller home. There is no question about Tom reaching his destination, for he is king of the alley and dogs as well as neighboring cats have long since learned to give him a wide berth. His wildcat instinct asserts itself the instant a combat is in progress. In fact, in one of his brothers the wild nature predominated to such an extent that he left for the woods.

Tom has regular habits and selects what he will eat. No matter how much fish or meat may be left on the butcher's block, he never touches it. Ordinarily he will walk to what is termed the board man, the one who fixes up the lunches, and rub against his legs until noticed. This is the signal that Tom is hungry. When in want of fresh meat he looks up the chef. There may be half a dozen cooks in the kitchen, but they are passed up unnoticed. Tom seems to know that the chef is the man, and when found, rubs against his legs until noticed. He is offered meat until the desired variety is reached, usually liver, and then he goes about his business.

Tom is very sociable, likes automobile rides and will sit up in his seat like a dog. He frequently takes strolls and will follow the night policeman up and down his beat like a watchdog. Tom can be found at Fuller's almost any time, but he cannot be bought.

HOUSEHOLD QUERIES

Beans With Spanish Herbs

Will you please tell me where I can get the Spanish herbs? How much do you put in of each to a quart of beans? If it is not too much trouble, would you give me the recipe?—Subscriber, Fallbrook.

Addresses of grocers carrying Spanish herbs have been mailed to inquirer. Recipe for using with beans follows:

One quart beans (dry); cook till half done or more; 1 large onion, 1 red pepper, 1 slice bacon, ½ cup salad oil or olive oil, pinch black pepper, salt, ½ can tomatoes, 1 large pinch Spanish herbs (use a little more of

the leafy herb than of the seed). Tie these two herbs together in cloth and add everything named except salt when beans are beginning to soften. Salt when about done.

Italian Salami

I see that you are asking for a good recipe for Italian salami. This is the real recipe for good salami (will keep for a year): 25 pounds pork with some of its own fat, medium grind and leave it stand over night on table in a warm place to drain. The next day add 10 ounces salt, 1 teaspoon nutmeg, 1 teaspoon cloves, 1 teaspoon cinnamon, 3 tablespoons ground black pepper, 2 grains saltpeter dissolved in ½ glass lukewarm water and sprinkled over meat. Work meat well with hands so it will stick together. Some use garlic and some don't. Then stuff in casings well tied. Leave hanging 40 to 60 days. This will keep well for over a year.—V. Luchetti, Reno, Nevada.

HINTS FROM HOUSEKEEPERS

Crumb Pie

Dissolve 1 teaspoon soda in 1 cup boiling water. Add 1 cup dark Karo syrup. Mix 4 cups flour, 1 cup light brown sugar, 1 cup lard until thoroughly blended. Save a large cup of this dry mixture, put rest with syrup, water and soda and divide in four pans that have been lined with a rich crust. Sprinkle the cupful of dry ingredients over top.

Antidote for Strychnine

I will give you a good antidote for strychnine poison. Just pry open the mouth of the animal and fill it full of dry table salt. It seems to kill the poison and the animal will not be stiff afterwards. We have saved dogs and cats both after they seemed almost gone. I have never seen it fail on either.—Mrs. D. Douglass, Fallbrook.

HOMINY GRITS

The first step in preparing grits for the table is to boil them, like any other cereal. Of course boiled hominy in the form of grits is frequently used for a breakfast food, or as a lunch or supper dish with a sweet sauce; its possibilities for dinner seem to be less familiar except in the south. For each cup of hominy grits four to five cups of water is allowed. This should be seasoned with two teaspoons of salt. The grits should be added slowly to the salted boiling water and cooked for ten minutes over the fire. Then the cooking should be continued for two hours in a double boiler or finished overnight in the fireless cooker.

The favorite combination of meat and grits in the south is "hog and hominy," which may be roast pork, fried pork chops or tenderloin, baked leg of pork, or fresh pork sausage, served with a generous helping of plain boiled hominy grits. Some of the fat from the meat is mixed with the grits in place of butter. Sometimes the idea of "hog and hominy" may be stretched to include ham or bacon, and there is no reason why those who enjoy salt pork should not eat it with hominy grits as a starchy vegetable.

The uses for leftover boiled hominy grits are innumerable. Grits are particularly good if cut in slices, dipped in flour and fried to a delicate brown. This can be served for breakfast or in place of a dinner vegetable. When planned for use in this way the warm boiled hominy should be poured into a bread tin or baking powder can to mould it into a form from which attractive rectangular or round slices can be cut. Fried hominy grits with maple sirup, honey or preserves is a uncheon dish or dessert that may be compared with waffles in satisfaction to the palate.

To vary ordinary muffins a small quantity of cold boiled hominy grits can be used instead of part of the flour. In making gems with any cooked starchy cereal it is necessary to have the batter stiffer than in all-wheat flour mixtures, since the cooked cereals contain a considerable proportion of water.

Hominy Muffins

1½ cups cooked grits, 1½ cups wheat flour, 1 teaspoon salt, 3 teaspoons baking powder, 2 tablespoons syrup or sugar, 1 or 2 eggs, 2 table-

spoons fat; liquid sufficient to make a stiff batter (about ½ cup). Sift together flour, salt and baking powder twice. Beat the eggs until light and add to the cold boiled hominy grits. Add the syrup or sugar, the melted shortening and flour mixture alternately with the liquid (milk or water) until a stiff batter is formed. Drop into greased muffin pans until half filled and bake 25 to 30 minutes in a moderately hot oven.

Hominy for Escalloped Dishes

A "one piece" dish for which boiled hominy grits forms the basis can be made in the same way as those scalloped dishes often prepared with bread. Arrange alternate layers of cooked grits with the food to be combined with it. Minced cooked beef or lamb, slices of pork or veal, fish picked from the bones, sharp cheese, grated, tomatoes, peppers, onions, celery, cabbage, vegetable mixtures. Any of these foods may be made into attractive dishes when scalloped with cooked grits. After the baking dish is filled, a cupful of white sauce should be poured over the combination and the whole may be covered with buttered crumbs and baked 30 minutes. Left over chicken may also be creamed and scalloped with hominy grits.

Hominy Turnover

1 pint cooked hominy grits, 1 cup milk, 1 teaspoon salt, 2 well beaten eggs. Mix all together. Turn into frying pan in which a tablespoon of

fat has been melted. Stir until hot throughout. When golden brown on the bottom fold like an omelet and serve on a hot platter.

LINCOLN CORN CRIB

Out in Nebraska where they have more corn than they know what to do with the Lincoln Crib proposes to store away some of the surplus which corn growers are finding so burdensome. This crib, started by the Lincoln Chamber of Commerce, was so successful that other cornbelt organizations are considering similar cribs.

Instead of being a huge storage house for corn this is an organization of about half a thousand men and women who call themselves the Corn Eaters of America. The purpose of the organization which is making rapid growth is to direct attention to the value and economy of corn and its products as food and to help reduce the surplus of this grain. The only failure in connection with the organization of the Lincoln Crib, according to the chamber of commerce, was that there was no banquet room in the city large enough to accommodate the hundreds who wanted to join as charter members.

With the help of the United States department of agriculture food bulletins and circulars an exclusive corn menu was planned. The first course consisted of cream of corn au gratin. Corn silk tobacco smoked in corn-cob pipes substituted for Havanas at the end of the dinner and in between

were courses of cornfed Nebraska pork loins, corn saute (hominy) with green pepper, corn on cob, corn bread, corn salad with pimentos, cornstarch pudding, corn cookies, and corn candy.

THE SCHOOL LUNCH

Mary Ann Gray, South Dakota State College

As important as knowing what to put in the lunch for school children is knowing how to pack the lunch so that it will keep fresh and tasty. Metal boxes or pails are the best because they can easily be cleaned and scalded to keep them in a safe condition. There should be no part of the container which cannot be cleaned thoroughly. Small air holes may be punched in metal containers making them more suitable for carrying moist foods which are likely to spoil.

Things least likely to crush should be packed on the bottom. Sandwiches, etc., should be wrapped in separate packages instead of all in one.

If no provision is made in the school room for serving lunches an extra napkin should be included in the lunch box for the child to spread over the school desk while eating. Napkins may be of paper or may be made out of cotton crepe, purchased for a small sum per yard. The edges of the napkin may be fringed and the napkin need not be ironed after washing.

Fruit and Nut Confection

This confection is a good one to be

Judging a Dentifrice

At the Poultry Shows you like to watch how carefully the judges examine each entry. You note how each individual point is thoughtfully weighed before the awards are made.

Just so in the selection of a tooth paste, you, like dentists, can judge each point with utmost care. Common sense tells you that you want a safe DENTAL CREAM which washes and polishes the teeth thoroughly, that has no harsh grit to "scratch" or "scour" the precious, protective enamel. And you want one without strong drugs, one which does not harm the delicate tissues of your mouth.

COLGATE'S Cleans Teeth the Right Way

"Washes" and Polishes—Doesn't Scratch or Scour

Impartial tests made by dentists "gave the Blue Ribbon" to Colgate's Ribbon Dental Cream—more dentists recommend Colgate's than any other. It not only cleans thoroughly but has a delicious flavor that encourages the habit of regular tooth brushing. You can get a LARGE tube of Colgate's Ribbon Dental Cream for 25c.

Ask also to see the other Colgate articles listed below. If your store doesn't have them all we will mail you samples as called for in the Coupon.

COLGATE & CO.

included in the school lunch box. It is also good to have in the house as an emergency novelty. Use 1 pound figs, 1 pound dried prunes or seedless raisins, 1 pound nut meats, confectioner's sugar. Wash, pick over and stem the fruits and put them with the nut meats through a meat chopper and mix thoroughly. Roll out to a thickness of about one-half inch on a board covered with confectioner's sugar. Cut into small pieces. If the candy is to be kept for some time the pieces should be separated by means of paraffin paper. This recipe makes about 24 two-ounce portions.

THINK OF YOUR GARDEN AS—

A Doctor: It can keep you in good health and sends no annoying bills.

Picnic Grounds: You can have a lot of fun in it if you approach it in the right spirit.

A Beauty Spot: To cover bare earth with green growing things is truly a work of art.

A Thrift Proposition: It gives you the opportunity to save the money you would otherwise have to spend for food.

A Sanctuary: Some one has said, "One is nearer God's heart in a garden than anywhere else on earth."

An Opportunity: Not only to add to your larder, but to broaden your intellect and sympathies as well.

Battle Ground: Never doubt for a moment that weeds and pests will rise up without number to engage your ceaseless efforts.

A Storehouse: If rightly planned it will supply a surplus of food to be stored away for bleak winter.

Recreational Proposition: It is just as enjoyable and far more profitable to play the game of gardening than golf or tennis.

An Old Friend: Enter lovingly into its moods and confidences and when you are deprived of its presence for a few bleak months look eagerly forward to its return—Farm Life.

NEIGHBORLINESS

A good neighbor is one who has tact enough to overlook the faults that your friends chide you with and has sense enough to expect nothing in return for his own graciousness. If it can be written on a man's tombstone that he was a good neighbor he will have a sweeter epitaph than can be earned by most of the kings of earth. The art of neighborliness is one we are slothful in acquiring in its community sense.

California has grown so fast and is still growing so fast that the business of being neighborly is being neglected. Families have settled down in busy and bustling districts and in a few months have pulled up stakes and moved from sheer loneliness. No one has shown interest in their welfare or being. They have been held as total strangers by those surrounding them. They were received with acclaim by the real estate agent who

sold them a lot or a home, but when it came to making that home they were as strangers in a strange land. Neighbors were neighbors in name only. As the boy in the street might say: They didn't even take time to give them the once-over. The art of neighborliness is something that can and should be cultivated and that community will thrive most and indicate the most substantial progress in which this art is best extended.—L. A. Times.

AIRPLANE RAID AT SEA

An airplane used in enforcement of U. S. prohibition laws raided the ship Anabelle off the coast of Florida. The ship was bringing in a cargo of 11,500 cases of whisky. Preparations have been quietly in the making for some time to bring to bear simultaneously airplanes, submarine chasers and reinforced land forces in Florida upon the illegal liquor craft said to be infesting southern waters. With airplanes as swift raiders to swoop down on run-runners stealing toward the coast, the prohibition authorities were understood to plan a patrol of submarine chasers from Maine to Key West which could spot the blockade runners and either relay reports of their location to the planes or make seizures themselves.

A LA CARTE

The Yank buddy was revisiting battle scenes and was amazed to see a group of men, all under the direc-

tion of a man in the uniform of a discharged French corporal, busily digging in the field.

"Queska vous diggy La, Pierre?" he asked in his best French.

"Ze sheil 'oie, M'sieu'," answered Pierre. "Ze las' parr-tie of lady and zhentlemen tourists from Amerique, zey are a leetle deesappointed wiz ze field of bataille."

CHANCE FOR MISCONSTRUCTION

"I don't know whether to accept this testimonial or not," mused the hair restorer man.

"What's the matter with it?" demanded the advertising manager.

"Well," explained the boss, "the man writes: 'I used to have three bald spots on the top of my head, but since using one bottle of your hair restorer I have only one!'"

ELUCIDATION BY DEMONSTRATION

Two sailors at a dog show were gazing at a valuable Skye terrier which had so much hair that it looked more like a woolen mat than a dog.

"Which end is 'is 'ead, Tom?" asked one.

"Blowed if I know," was the reply, "but 'ere, I'll stick a pin in 'm, and you look which end barks!"

SCARCELY ACCOUNTED FOR

One never loses anything by politeness, but a lot of people seem afraid to risk it.—Boston Transcript.

You just know
she's a clever hostess

She's never "fussed"—never at a loss—no matter how many "drop in" of an afternoon. For she knows that Ghirardelli's—back there in the pantry—can measure up to any occasion. She knows, too, that nothing puts people at ease, nothing makes them feel quite so "homey" as a piping hot cup of this delicious chocolate.

Dairy Cow Contest Awards

The awards in the state dairy cow competition described by Prof. Woll in the last issue were as follows:

I. Herd Prizes: Highest production of butter fat by ten cows in a herd during ten consecutive months.

Class 1. Jerseys or Guernseys—1, \$200, H. G. Gross, Eureka (J.), 472.15 lbs. actual butter fat; credit, 523.87. 2, \$150; J. W. Coppini, Ferndale (J.), 456.78; 502.79.

Class 2. Holsteins—1, \$200, Fred Hartsook, Lankershim, 589.07 lbs. actual butter fat; credit, 634.89. 2, \$150, Burr Farm, Los Angeles, 527.96; 599.88.

Class 4. Grades or Cows of Unknown Breeding—1, \$300, Earl Graham, Compton, 555.39 lbs. actual butter fat; credit, 642.01. 2, \$200, J. A. Genzoli, Loleta, 568.50; 595.22. 3, \$100, Nate Hauck, Alton, 513.27; 563.53.

II. Individual Prizes: Highest production of butter fat by cow during ten consecutive months.

Class 5. Jerseys or Guernseys—1, \$100, H. G. Gross, Eureka (Lydia's Valentine, J.), 575.84 lbs. actual butter fat; credit, 679.49. 2, \$75, A. B. Humphrey, Escalon (Calla Grove Itchen May, G.), 587.73; 675.89. 3, \$50, J. W. Coppini, Ferndale (Noble's Sayda Polo, J.), 652.27; 652.27. 4, \$25, H. G. Gross, Eureka (Raleigh's Echo Girl, J.), 505.05; 626.26.

Class 6. Holsteins—1, \$100, Fred Hartsook, Lankershim (Bessie Snowball DeK.), 777.62 lbs. actual butter fat; credit, 839.83. 2, \$75, Fred Hartsook, Lankershim (Miss Aaggie Ormsby Segis), 644.86; 799.63. 3, \$50, Palo Alto Stock Farm (Alta Papoose), 720.99; 778.67. 4, \$25, Anita M. Baldwin, Santa Anita (Anoakia Walker Pontiac), 620.94; 769.97.

Class 7. Ayrshires or Dairy Shorthorns—1, \$100, J. Henry Meyer Est., Watsonville (Finlayson's Annie L., Ay.), 487.05 lbs. actual butter fat; credit, 487.05. 2, \$75, J. D. Rowe & Sons, Davis (Alma, Sh.), 416.62; 449.95. 3, \$50, J. Henry Meyer Est., Watsonville (Bright Eyes of Highl., Ay.), 442.60; 442.60. 4, \$25, J. Henry Meyer Est., Watsonville (Substantial's Patricia, Ay.), 396.25; 396.25.

Class 8. Grades or Cows of Unknown Breeding—1, \$100, L. A. Co. Farm, Hondo (Princess, gr. H.), 644.57 lbs. actual butter fat; credit, 799.27. 2, \$75, H. L. Wakeham, Santa Ana (Jim's Wonder, gr. J.), 795.53; 795.53. 3, \$50, Earl Graham, Compton (Tomie, gr. H.), 650.88; 748.51. 4, \$25, Earl Graham, Compton (Alice, gr. H.), 567.94; 738.32.

III. Special Prizes Registered Bulls and Dairy Apparatus.

Class 9. Registered dairy bull calves. Highest average production of butter fat during ten consecutive months by a grade or common dairy herd of less than 25 cows:

Choice of a Jersey bull calf donated by Dr. H. G. Gross, Eureka, a Guernsey bull calf donated by A. B. Humphrey Co., Escalon, and a Holstein bull calf donated by Bridgeford Holstein Co., Patterson.

N. Hauck, Alton, 513.27 lbs. actual butter fat; credit, 563.53. P. Iversen, Grizzly Bluff, 475.85; 535.53. S. J. Damon, Ferndale, 377.56; 432.10.

Class 10. For the pure bred dairy herd having the largest proportion of completed records over 300 lbs. butter fat for ten consecutive months.

One Babcock 24 bottle hand tester, donated by Creamery Packing Manufacturing Co., San Francisco. Fred Hartsook, Lankershim, 17 records.

IV. Special Cash Prizes.

Class 11. California Cultivator Monthly Prize of \$25 (or silver trophy of equal value) for highest average production of butter fat by pure bred sires in herd headed by pure bred sire. September, 1920, to January, 1922:

September, 1920, Chas. F. Holman, Stockton, average production butter at, lbs., 69.38. October and December, 1920, and February and October, 1921, Earl Graham, Compton, 83.26, 5.96, 62.03. November, 1920, and January, 1921, L. A. County Farm, Hondo, 9.81, 78.45. March, 1921, F. F. Pelssier, Whittier, 75.70. April, 1921, A. Genzoli, Loleta, 83.04. May and August, 1920, Eug. Blondini, Ferndale, 2.26, 71.26. June and September,

1921, Nate Hauck, Alton, 74.93, 59.16. July, 1921, W. Terkelsen, Ferndale, 66.16. November, 1921, W. F. Early, Grizzly Bluff, 48.72. December, 1921, Peter Iversen, Grizzly Bluff, 48.62. January, 1922, M. L. Pontoni, Arcata, 43.56.

Class 12. Largest three numbers of complete ten month record in herds tested by a contesting association tester, three prizes—1, \$100, C. A. Casanova, Ferndale, Ferndale Cow Testing Association, 107 records. 2, \$75, L. J. Birgo, Los Angeles, L. A. County Cow Testing Association, 83 records. 3, \$50, Sam H. Moore, Los Angeles County Cow Testing Association, 59 records.

V. Trophies and Medals.

Class 13. Highest average production butter fat for one year by herds belonging to cow testing association, three silver cups, offered by the County Life Department, Sacramento Bee: (a) Herd less than 25 cows, J. W. Coppini, Ferndale, 11 cows; average production butter fat, lbs., 494.39. (b) Herd 26-50 cows, J. A. Genzoli, Loleta, 45; 444.57. (c) Herd 50 cows or over, J. D. Early, Grizzly Bluff, 72; 397.12.

Class 14. Highest production of milk during ten consecutive months by a cow, irrespective of breeding, silver trophy donated by A. W. Scott Co., San Francisco: Earl Graham, Compton (Princess Maida Veeman, 467.343, H.), 26,119 lbs. milk; 798.15 lbs. butter fat.

Class 15. Highest records of registered Jersey and by ten cows in a grade herd sired by Jersey bull, two cups offered by the American Jersey Cattle Club, New York City: (a) Highest record by registered Jersey cow, Bonnikson Bros., Ferndale (Financial C's Loretta D.), 689.97 lbs. actual butter fat; credit, 689.97. (b) Highest

average record by ten grade Jerseys—Nate Hauck, Alton, 513.27; 563.53.

Class 16. Highest record by registered Guernsey cow and ten cows in a grade herd sired by a Guernsey bull, two trophies, offered by the American Guernsey Cattle Club, Peterboro, New Hampshire—(a) Highest record by registered Guernsey cow, A. B. Humphrey Co., Escalon (Calla Grove Itchen May), 587.73 lbs. actual butter fat; credit, 675.89. (b) Highest average record by ten grade Guernseys, Adohr Stock Farms, Van Nuys, 464.34; 495.53.

Class 17. Highest record by registered Holstein cow and ten cows in grade herd sired by registered Holstein bull, two silver cups, offered by the Holstein Friesian Association of America, Brattleboro, Vermont.—(a) Highest record by registered Holstein cow—Earl Graham (Princess Maida Veeman), 798.15 lbs. actual butter fat; credit, 941.82. (b) Highest average record by ten grade Holsteins—Earl Graham, 561.82; 648.02.

Class 18. Highest record made by a registered Ayrshire cow, cup offered by the Ayrshire Breeders' Association, Brandon, Vermont—J. Henry Meyer Estate, Watsonville (Finlayson's Annie Laurie, 36968), 487.05 lbs. actual butter fat; credit, 487.05.

Class 19. Highest record by registered Shorthorn cow, a silver trophy offered by Alexander & Kellogg, Suisun—John D. Rowe & Sons, Lessees, Davis (Alma, 577635), 416.62 lbs. actual butter fat; credit, 449.95.

Class 20. Two herds having largest and next to largest number cows producing over 300 lbs. butter fat in ten consecutive months; two silver trophies offered by California Dairy Council, San Francisco, and De Laval Separator Co., San Francisco—(a) De Laval Separator Co. trophy—Adohr Stock Farms, Van Nuys, 47 records. (b) California Dairy Council trophy—Arden Certified Dairy, El Monte, 40 records.

Class 21. Highest average produc-

tion butter fat by grade herd (not less than four cows) all daughters of single pure bred sire, silver trophy offered by the Pacific Dairy Review, San Francisco—Nate Hauck, Alton, eight daughters of Chief Alton, 123772, 479.20 lbs. actual butter fat; credit, 508.26.

Class 22. Highest production butter fat by Humboldt County cow (all cows winning other individual prizes in the contest to be barred), three cash prizes offered by the Humboldt County Dairy Farmers' Association, Ferndale—1, \$25, J. A. Genzoli, Loleta (Jill, "Common"), 660.49 lbs. actual butter fat; credit, 660.49. 2, \$15, L. M. Pontoni, Arcata Klamath (gr. J.), 659.12; 659.12. 3, \$10, Nate Hauck, Alton (Red, "Common"), 549.29; 631.68.

GOATS COMBINE

The Goat World, published in Los Angeles, devoted to the upbuilding of the milk goat industry, has purchased the milk goat section of the Angora and Milk Goat Journal published at Portland, Oregon. Editor Heintz says in making announcement of the change: "With the purchase of the milk goat department of the Angora Journal we become the publishers of the only magazine in the world devoted to milk goats. The Angora Journal occupies a like relation to the mohair industry."

PROFIT IN GUINEA PIGS

"Profit in Guinea Pigs, Breeding, Management, Varieties and Practical Knowledge of Cavies," by J. A. Roberts, D. V. M., published by the author, Hollywood.

This is a 100 page book filled with halftones and other illustrations. There is a bit of history and description of various kinds of cavies. Following this comes the commercial use of cavies, housing, feeding, breeding, preparing for exhibition, ailments, with a series of special articles on meat and fur production.

Every user becomes a Red-Top booster

OUR Southern District Manager writes: "We sell our dealers on the Red-Top idea and they in turn sell their customers. After that the tires sell themselves; every user becomes a Red-Top booster and an endless chain of Red-Top

salesmen is constantly being made."

The extra-heavy and extra-tough red tread, the extra ply of fabric, the extra size—these make the Fisk Red-Top a wonderful tire for small cars and on country roads.

Spring Is Here

Now come the Pigs—the Calves—the Colts—and the Lambs.

TIME for your work horses and mules to shed their winter's coat.

—TIME to tone them up—give their systems a spring house-cleaning—and drive out the worms.

Dr. Hess Stock Tonic

A Spring Conditioner and Worm Expeller

Your COWS that have long been on winter feed need the system-toning, bowel-cleansing, appetizing effects of Dr. Hess Stock Tonic. Puts them in fine condition for calving. It means more milk.

Your BROOD SOWS will be relieved of constipation and put in fine fettle for farrowing by a course of Dr. Hess Stock Tonic,—which means healthy pigs, and a mother with an ample milk supply to nourish them.

Your SHOATS will be greatly benefited by a course of Dr. Hess Stock Tonic. It drives out the worms—stimulates the appetite and makes them thrive.

Feed it to EWES before lambing time. It prevents fevered udders and scouring lambs. Feed it after lambing time to stimulate the flow of milk, insuring lambs for the early market.

Dr. Hess Stock Tonic contains Tonics for the digestion, Laxatives for the bowels, Diuretics for the kidneys, and Vermifuges for the worms.

Always buy it according to the size of your herd. Tell your dealer how many animals you have. He has a package to suit. Good results guaranteed.

Why Pay the Peddler Twice My Price?

25 lb. Pail, \$3.50 100 lb. Drum, \$12.00
Smaller packages in proportion.

Miss California Gibson

WHEN Miss California Gibson was elected by the supervisors of Glenn County in January to serve as one of the three directors of the \$15,000,000 Glenn-Colusa irrigation district, a California woman took a position in the agricultural life of the state that is attracting nation wide attention.

It is not as a novice, however, that Miss Gibson assumes her duties on the directing board of this irrigation district, which is the third largest in the United States. Since the death of her father in 1906 she had shared with her brother the management of the J. S. Gibson Company Ranch, three miles northwest of Williams. Since the death of her brother, Gion Gibson,

California Gibson

in January Miss Gibson, or "Miss California," as her neighbors know her, has been in full charge of this half million dollar property.

As a girl California Gibson had been given broad social and educational opportunities. "What I liked best when I was a girl," Miss Gibson says, "was to help my father in the management of the ranch, and particularly to ride the range." The Gibson Ranch in those days was a stock ranch with thousands of acres of range land in the foothills. Gibson had bought his first acres from the government in 1854, he had prospered, and throughout Northern California his hospitality and generosity were known far and wide. Gion Gibson, her brother, was a graduate of Stanford University, with a degree in engineering. It was under his supervision that the machinery equipment of the ranch was installed and operated. Miss Gibson's more particular interest was with the stock. She can mend a trac-

tor and drive it when necessary, but the building up of a dairy herd with the aristocratic Alcartra and DeKol stock, and the management of flocks of prize turkeys, has been her greatest interest.

The University of California has a representative on the Gibson Ranch checking up the records of several cows in the herd that are under test for prize milk production, the sort of cows that are milked four times a day, and eight of which are producing 85 gallons of milk a day.

To succeed to the management of the Gibson ranch on the death of her brother was a natural opportunity for California Gibson, but as it happened the people of the two counties gave a stronger testimonial to her ability to succeed to the full work of her brother. Gion Gibson had been one of the three directors of the Glenn-Colusa irrigation district, with 103,000 acres of the best lands in the two counties and upon its successful management depends the welfare of the towns of Colusa, Williams, Maxwell, Willows, Hamilton and numerous smaller settlements. The supervisors sought a successor to Gion Gibson. The women of the two counties proposed California Gibson. The shrewdest and most influential politician in the district remarked that "California Gibson is fitted in every way to be a member of the board, but she is a woman." The women said: "Appoint the best fitted, whether man or woman." And to back up their advice the women held a mass meeting on January 26, after which they organized an automobile parade, visiting each supervisor and demanding "Miss California's" election to succeed her brother on the board. The supervisors had an all day meeting on the 27th, without result. On the one hand were the evident qualifications of California Gibson for the important position. On the other hand was the repeated objection of the politicians—"But she is a woman." However, on the morning of the following day another meeting was held, which resulted in the appointment of Miss Gibson.

"In a way it is nothing new to me," Miss Gibson says. "I know what it is to live 'at the end of the ditch,' and the problems of the district have been my problems for years. I would rather take this place in the management of the ranch and in the management of the district than to spend my time in any social position in the state."

A Great Guernsey

Sylvia of Frankland 64380, a Guernsey cow bred by J. Howard Leman, Boston, Massachusetts, and owned and tested by Brant Rancho, Owensmouth, is the new state champion in her division in California and the tenth cow in Class B. Her record completed in November, 1921, has been verified by the American Guernsey Cattle Club and the production credited to her is 16,976.7 pounds milk and 776.66 pounds butter fat.

At the 1921 California State Fair Sylvia of Frankland 64380 won first prize in the aged cow class and was

also made senior and grand champion female, first prize advanced register cow, and first prize over all breeds in the cow testing association class. She was a member of the first prize exhibitor's herd and dairy herd, which honors she duplicated at the San Fernando Valley Fair.

Sylvia of Frankland 64380 dropped her first calf in March, 1918, and was put on test during the war, but owing to labor conditions at that time no attempt was made to make anything more than just herd records and the cows were all milked with a machine.

Sylvia of Frankland

When Writing Advertisers Please Mention the Cultivator.

She was bred early, finished in class GG with 344.73 pounds butter fat, dropped another calf in 1919, and milked well but was not tested. She dropped her third calf in November,

WHY SUFFER LOSS FROM SICK COWS!

Easy Home Treatment Keeps Cows Healthy and Profitable

Cows are pretty hardy animals. Practically the only diseases they suffer from are those which result from weakened vitality of genital or digestive organs. These, of course, are serious because they immediately reduce the milk-flow—and milk is money. We get scores of letters weekly like this one from W. H. Lawson, Petrolia, Ont., a dealer who sells Kow-Kare:

"We handle a lot of 'cow tonics,' 'regulators,' etc., but when it is up to us to sell something we can guarantee, we sell Kow-Kare. Only last month, we saved a valuable Registered Durham cow valued at \$250 with Kow-Kare. The cow retained the afterbirth and after ten days' doctoring the veterinary said to kill the cow. The owner happened in when we were recommending your Kow-Kare, and told us his trouble. We donated a box of your Kow-Kare and he came back in five days for another box and paid for both."

As a sample of the endorsements we get from cow owners themselves, read this letter from C. E. Dodge, De Wittville, N. Y.:

"Since I have been on the County Farm, I have been using Kow-Kare in the dairy for the last ten years. I have 52 cows. My experience is that a few dollars worth of Kow-Kare saves us a great many dollars worth of veterinary bills, and also every cow in the dairy that I feed it to produces more all the year thru because of the Kow-Kare. I have no sick cows or trouble, when I begin feeding Kow-Kare, from the first of January until I turn them out in the Spring."

You, too, can be free of such cow ailments as Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc., by using this reliable cow medicine. General store, feed dealers and druggists sell it at the new reduced prices—65c and \$1.25.

1920, and started her test five days later. Sylvia was a very heavy milker averaging 54 pounds a day in her fourth month when she made 69.81 pounds butter fat. She was very persistent, producing over 60 pounds butter fat in every month of the year except one, during the show season, when she produced 58.3 pounds. She produced from 1,200 to 1,600 pounds milk every month except when on the show circuit, making her a very valuable cow as her milk sells with that of the rest of the herd at 28 cents per quart.

ARIZONA CATTLE SHIPMENTS DECLINE

Cattle shipments from Arizona have been on the decline since 1919, according to the report of the state livestock sanitary board. The shipments in 1919 were 262,788 head; in 1920, 194,357, and in 1921, 191,203. Arizona slaughtering figures in 1919 were 104,606 head; in 1920, 87,275, and in 1921, 66,075. More than half of last year's shipments went to California points, with Texas second. California took more cattle than in 1920.

CALIFORNIA'S CATTLE INDUSTRY

A conservative estimate of the number of stock cattle grazing annually in California is 1,250,000 and the number of cattle taken from the ranges of the state annually for immediate slaughter is approximately 327,330 steers, 242,168 cows, 21,673 calves, 7,717 bulls and stags.

The estimated value of range herds can reasonably be placed at \$151,000,000. The estimated value of lands for grazing is \$250,000,000. The estimated amount of capital invested in the cattle raising industry is approximately \$400,000,000. J. B. N.

HG RANCH MAKES BIG AYRSHIRE DEAL

One of the largest deals in Ayrshire cattle for the year was recently made when Mr. and Mrs. Harry Gantz, Santa Ynez, purchased three carloads from Washington breeders to be shipped to their ranch near Santa Barbara. One carload was secured near Montesano and the other two were taken from Whatcom County. The HG Ranch operates a large dairy, which caters to an exclusive trade in cream. About two years ago Ayrshires were tried for the first time with so satisfactory results that plans were soon made to replace the entire herd with the Red and White breed as fast as possible.

Such a purchase will go far to open the eyes of the dairymen of the Pacific Coast to the commercial advantages of the Ayrshire cow and should lead to similar deals in the near future. Western breeders are confident that no more valuable friends to the Ayrshire breed could be found anywhere than Mr. and Mrs. Gantz.—Ayrshire Digest.

PURCHASE FINE STOCK

Purchase of a few registered Guernsey heifers as a foundation for a small high class Guernsey herd at the agricultural college of the state college of Washington was authorized by the regents at their last meeting.

Purchase of the Holstein bull Segis Pontiac De Kol II for the Western Washington experiment station was consummated and a report made as to cattle and sheep exhibited in the coast district this winter by the animal husbandry department.

Chinook Segis Pontiac Ike, prize winning Holstein bull which won ribbons as senior calf last year on the show circuit, has been sold to a group of farmers near Colton.

Maxwell's Landseer Lad, head of the college Jersey herd, has been loaned to farmers near Dayton for two years as a part of the county agricultural agent's campaign for better sires to improve herds.

BULLETIN ON CATTLE DISEASE

Dr. J. W. Kalkus, veterinarian of the Washington experiment station, is author of the new bulletin on Abortion Disease of Cattle, just published by the extension service of the state college. In it he discusses the nature of the disease, method of its spread, symptoms and diagnosis, prevention and immunity, and treatment.

ANNOUNCING THE NEW AND COMPLETE LINE OF NATIONAL SILOS

THE CYCLONE
The Finest Silo Built

THE IRONCLAD
The Best Silo in its Class

THE ATLAS
The Cheapest Factory Made Silo, and a Mighty good one

Get Full Facts And Prices on These Three Profit Builders

LIVESTOCK SALE CALENDAR

Holsteins

April 5, Guaranty Sale, Rhoades & Rhoades, Pavilion, Hynes.

Los Angeles County Farm, Hondo, has recently added two more noteworthy official records in its herd of registered Holsteins. Hollywood Lilith Palmyra Abbekerk as a senior four year old made 30.44 pounds butter from 685.7 pounds milk in seven days, and 125.05 pounds butter from 2,902.7 pounds milk in 30 days. She has now been on semi-official for 145 days and has to her credit 541.2 pounds butter and 12,774.0 pounds milk. She completes three direct generations of 30 pound cows, her dam Hollywood Abbekerk Korndyke having a record of 30.01 pounds butter in seven days, and her second dam, Pietertje Korndyke Abbekerk, having a record of 35.38 pounds butter in seven days. She and her three nearest dams also have yearly records, the four, including her own three year old record, averaging over 915 pounds of butter. She is sired by Hollywood Lilith Palmyra, one of the great sires bred and developed at Hollywood Farm, Hollywood, Washington. The other record lately made is that of the junior three year old Lilith De Kol Tritomia, that made 27.35 pounds butter from 578.7 pounds milk in seven days. She is sired by Sir Bessie Fobes Tritomia and out of a daughter of Hollywood Lilith Palmyra. The first mentioned heifer above was purchased for the farm by Wm. R. Harriman in the 1921 guaranty sale at Sacramento, from Carnation Stock Farms, Seattle, and the latter heifer from Toyon Farm Association, Los Altos, in their dispersal sale in April, 1921.

J. L. Sebastian, Wasco, is making some excellent records in his small but select herd of registered Holsteins in the first season of testing. Following the 30 pound record recently reported in the herd several other members of the herd have gone on test. Twilight Shadow of Packwood, a daughter of Segis Pontiac Crane De Kol, made 26.39 pounds butter from 651.1 pounds milk, milking from three quarters of an udder. Alpha Aaggie De Kol Wasco, at two years nine months, made 22.77 pounds butter from 485.3 pounds milk. Centella Victoria Walker, at one year 11 months made 18.09 pounds butter from 407.1 pounds milk.

H. G. Ball, Tulare, is starting off official testing with most satisfactory results. Belle Pontiac Maid made 31.24 pounds butter from 472.3 pounds milk in seven days, while her half sister, Lady Pontiac Zenobia, as a senior four year old, made 27.39 pounds butter from 441.2 pounds milk in seven days. Both of these are sired by Segis Pontiac Crane De Kol, the son of Segis Pontiac De Kol Burke that formerly headed Walter Mitchell's herd at Visalia. The third record made in Mr. Ball's herd recently is that of the mature cow Jennie Wren Edith Pride, with 25.47 pounds butter from 433.4 pounds milk in seven days.

W. J. Higdon, Tulare, continues to add substantial records to his choice young herd as the heifers freshen. Johanna Gelsche Walker, a senior three year old daughter of Prince Gelsche Walker, after making 31.40 pounds butter from 504.9 pounds milk in seven days, made 125.8 pounds butter from 2,415.1 pounds milk in 30 days and is going strong on the beginning of a yearly test. Rosina Creamcup Mead, a senior two year old daughter of King Ignaro Mead, made 19.68 pounds butter from 432.5 pounds milk in seven days. Korndyke Creamcup, the beautiful junior two year old daughter of King Korndyke Pontiac 20th, which Mr. Higdon purchased in the 1921 guaranty sale from A. W. Morris & Sons Corporation, finished her 305 day record with 700.3 pounds butter from 13,549.1 pounds milk, carrying a calf 206 days. Two other first calf daughters of King Korndyke Pontiac 20th now on test are both over the 20 pound mark and increasing.

Frank M. Helm, Fresno, is securing most gratifying results in the first season of official testing in his big herd at Corcoran. The latest records reported by herdsman Harry L. Redd include Jessie Segis It, with 32.49 pounds but-

ter from 586.7 pounds milk in seven days, and she later milked as high as 103 pounds in one day. She is a daughter of It Findaella, a son of It. Helm Burke Lyons Segis, a junior four year old daughter of Crown Prince Segis, made 28.51 pounds butter from 510.1 pounds milk in seven days, while Helm Bessie Walker, a junior four year old daughter of Prince Juliana De Kol Walker, made 27.44 pounds butter from 601.9 pounds milk in seven days.

The most remarkable records yet made by the daughters of one sire in California are those now being made by the daughters of the six times grand champion show bull, King Segis Alcartra Prilly, owned by Bridgford Holstein Co., Patterson. About the time the sensational junior three year old Louise Alcartra Prilly was completing her world's record of 40.19 pounds butter in seven days, her half sister, Miss Ormsby Alcartra Prilly, increased her previously reported state senior two year old record to 29.35 pounds butter in seven days and has made 117.71 pounds butter from 2,465.2 pounds milk in 30 days, all California records for age. Maid Pontiac Prilly, freshening at two years and two months, made 26.75 pounds butter from 540 pounds milk, the butter production being the California record in class. Since January 1, 1922, the daughters of King Segis Alcartra Prilly have broken eight California records and two world's records. Another daughter of the same sire, Miss Alcartra Pontiac Prilly, as a senior three year old, made 28.63 pounds butter from 669.1 pounds milk in seven days without being dry at the end of her first lactation period.

The 1922 guarantee sale which will be held at Rhoades & Rhoades Sale Pavilion, Hynes, on April 5, will have the largest list of consignors yet represented in the annual California Holstein classic. More than 20 herds will be represented with a total of over 60 head of choice Holsteins including cows with records up to over 38 pounds butter in seven days. Approximately 40 per cent of the cattle are from southern California herds and 60 per cent from north of Tehachapi. The committee of selection after making the rounds reports this to be one of the choicest lots ever presented for sale in California, a class of cattle entirely suitable for the best foundation material.

California Holstein-Friesian Association starts the year 1922 with the largest paid in advance membership in its history, and the month of January broke all previous records in number of voluntary applications for membership from new members. With its treasury in splendid condition and with no occasion for drives of any sort the association is planning an active year in promotion work through established channels.

In January, 1917, California Breeders Sales and Pedigree Company promoted a sale of registered Holstein bulls which were sold at public auction at Gonzales, and as far as we know it was an original idea and the pioneer Holstein bull sale in America. The performance was repeated in 1918, 1919, and 1920, about 20 bulls being sold each year. No sale was held in 1921, but on February 25, 1922, the company held its fifth bull sale at Gonzales, selling 21 head of yearlings and calves for Fred W. Kiesel, Jane Garden Farm, Sacramento, for an average of \$164 and a top of \$485. Practically all of the dairymen in the rich Gonzales section are Swiss-Italians and the fact that in these five sales within five years they have bought about 110 registered bulls, besides a large number bought at private treaty from individual breeders, indicates something of their appreciation of better blood. In this last sale 13 buyers absorbed the offering, eight head going to A. J. Molera, Monterey, one of the largest land owners of Monterey County, who has part of a 4,000 acre ranch subdivided and leased to dairymen, besides owning many cattle himself. Following is list of catalog numbers of bulls sold with name of buyers and price paid: No. 1, P. Scattini, \$135; No. 2, L. Buzzani, \$145; No. 3, A. J. Molera, \$195; No. 4, A. J. Molera, \$145;

You pay for a DeLaval whether you buy one or not

If you are using a worn-out, inferior cream separator, or skimming cream by hand, you are surely wasting enough cream to pay for a De Laval in a short time.

The selection of a cream separator is more important than that of any other machine on the farm, for none other can either save or waste so much, twice a day, 365 days a year.

A De Laval Separator will:

—Skim cleaner for many more years than any other;

—Skim milk clean at lower temperature than any other separator;

—Deliver a higher testing cream, which is more acceptable to the creamery, and easier and less costly to ship,

—And deliver a cream which will make better butter.

Mechanically a De Laval Separator is the best that fine materials and skilled workmanship can make.

—It lasts longer than any other separator, many giving good service for 15 to 20 years.

—It is easier to turn.

—It is easier to clean.

—It is so simple that one tool will set it up or take it down.

—It has the most perfect lubricating system.

Do not be deceived by separators which are claimed to be "just as good and cost less." When you consider its greater savings, greater reliability, longer life, the extra time it saves, and the greater satisfaction it gives, the De Laval is, in the end, by far the most economical cream separator made.

Even if you have only two cows it will pay you to have a De Laval. One can be bought on such easy terms that it will pay for itself in less than a year. Why not see your De Laval agent at once or write us for full information?

DE LAVAL PACIFIC CO.

61 Beale St., San Francisco

Sooner or later you will use a
De Laval
Cream Separator and Milker

No. 5, A. M. Allean, \$120; No. 6, A. J. Molera, \$190; No. 7, Frank Gouthier, \$485; No. 9, Mrs. Chas. Bedolla, \$140; No. 10, Carr & Co., \$155; No. 11, A. J. Molera, \$105; No. 12, A. J. Molera, \$175; No. 13, A. J. Molera, \$130; No. 14, S. A. Gnesa, \$155; No. 16, Sam Rianda, \$105; No. 17, Mrs. Chas. Bedolla, \$150; No. 18, A. J. Molera, \$165; No. 19, Joe Tommassini, \$110; No. 20, Anderson Bros., \$110; No. 21, Gerry Pura, \$175; No. 22, R. Del Porte, \$140; No. 23, A. J. Molera, \$220.

A. W. Morris & Sons Corporation, Woodland, has recently completed a number of short time records. Flossie De Kol of Nevada, who is developing into one of the great producers of the herd, made 36.65 pounds butter from 631.2 pounds milk in seven days, and 146.10 pounds butter from 2,891.1 pounds milk in 30 days. Betsy Lamb Prilly, the grand champion show cow, has freshened again and in seven days made 29.73 pounds butter from 632.2 pounds milk. Cornucopia Johanna Mead, a junior four year old daughter of King Mead of Riverside, made 24.82 pounds butter from 476.1 pounds milk in seven days. Ignaro Creamcup Pontiac Burke, a daughter of Segis Pontiac De Kol Burke, made 23.06 pounds butter from 517.4 pounds milk in seven days.

W. A. Walker, Ripon, has a string of cows on long time test that promise a remarkable average for a herd of modest size. He had one keen disappointment recently, however, when Belle Faskie Hengerveld De Kol 2d, grand champion at Sacramento in 1918, had to be taken off test at the end of 233 days owing to a slight injury to one of her teats that nevertheless seriously interfered with her production. In that time she had made over 800 pounds butter and over 23,000 pounds milk and was headed for a 1,000 pound record.

When T. J. Gist & Sons, Tulare, make their semi-dispersal of 60 registered Holsteins on April 12 it will mark the first time in California that a large number of females will be sold bred to a grandson of May Echo Sylvia. No less than 35 females in the offering are bred, many to calve this spring, to King Segis Sylvia Colantha, the Gist junior herd sire, who is by the \$106,000 bull, Carnation King Sylvia, and out of a good record daughter of Dutchland Governor Sir Colantha.

The American Shorthorn Breeders' Association announces that the classification in the get of sire will remain the same for this year as has been in effect. It was planned to change the classification so that ownership was required, the entry to include two bulls and two females bred and owned by the exhibitor. As this change did not reach the association of fair managers until after its annual meeting it was decided to continue the classification as formerly, four animals, any age, either sex, ownership not required, for the current year.

A quota of ten head has been apportioned to California for entries in the national sale to be held at Kansas City, Missouri, in June. An effort is being made to fill the quota but so far the owners of Holsteins of national sale quality have proved disinclined to part with them.

SEMI-DISPERSAL 65 REGISTERED HOLSTEINS

T. J. GIST & SONS HERD

Tulare, Calif.

Wednesday, April 12, at 10 A.M.

In order to rearrange their farming operations, T. J. Gist & Sons will sell at public auction their entire herd of registered Holstein females of milking age, a choice lot of bred heifers, and a good lot of young bulls, retaining their unbred heifers and heifer calves as the nucleus for their future herd.

Considerable official testing has been done in the herd and the sale offers a substantial number of young cows and heifers with official records up to over 26 lbs. butter in 7 days.

A FEATURE OF THIS OFFERING IS THE FACT THAT IT INCLUDES 35 ATTRACTIVE COWS AND HEIFERS BRED TO KING SYLVIA SEGIS COLANTHA, WHO IS A SON OF THE \$106,000.00 BULL CARNATION KING SYLVIA AND OUT OF A GOOD RECORD DAUGHTER OF DUTCHLAND GOVERNOR SIR COLANTHA, ONE OF THE BEST PROVEN SONS OF COLANTHA JOHANNA LAD.

The breeding represented in this herd is that of some of the most desirable producing families and the cattle will be offered in excellent physical condition.

Every animal guaranteed to be a breeder; no tuberculin test certificates.

The upward swing in business is certainly under way, and to the Holstein breeder that means that within a few short years there will be present the greatest market for registered Holsteins that the world has ever known at prices as high or higher than in any previous cycle.

For years past the breeder of registered Holsteins has not been compelled to depend upon the prices of a boom market to make a profit. Between the peaks of high prices there has always been present a steady demand for breeding stock at profitable prices.

Breeding herds good enough to command the top prices in a top market are not built in a day nor a year, and the breeder who is keeping his feet on the ground and his eyes on the future will lose no time in founding his herd upon the best animals obtainable or in strengthening his already established herd by the addition of such animals.

This sale provides one of the outstanding opportunities for the purchase of high class registered Holsteins, including

Cooperation's Victory

By Charles W. Holman

AMERICAN farmers have won their biggest legislative fight. After nearly four years a bill to legalize cooperative marketing has passed both houses of the congress. The senate on February 8 by a vote of 58 to 1 passed the Capper-Volstead bill in substantially the form it passed the house.

The big fight in the senate was over the question of adopting the substitute bill reported from the committee on the judiciary. This bill, written by Senator Walsh of Montana, proposed to strike out all of Section 2 of the house bill and amend Section 1 in two important respects: Providing that nothing contained in Section 1 of the house bill should in any way affect Section 2 of the Sherman Anti-Trust Act, the section forbidding the creation of or attempt to create a monopoly in any part of the supply of a product. Providing that cooperatives shall not handle the products of non-members in an amount exceeding in value the products of members.

To the second amendment attached to Section 1 of the bill farm leaders made no objection and it was adopted by the senate. To the monopoly restriction and to the attempt to take the jurisdiction away from the secretary of agriculture as provided in Section 2 of the house bill, strenuous objection was made. This resulted in the defeat of the senate substitute by the vote of 56 to 5.

Some differences of opinion arose among the senators in the debate as to the exact meaning of Section 2 of the bill on the point whether a price fixing power was conferred on the secretary of agriculture. The leaders for the house bill called the farm organization representatives into conference, and it was agreed that the order is-

sued against a cooperative association found guilty of monopolizing and restraining trade to such an extent as to unduly enhance a price of a product should be directed against the monopolization and restraint of trade and not against the price of a product. This amendment was introduced by Senator Lenroot and thus saved a long drawn out squabble over the possibility of conferring price fixing powers upon an executive officer of the government.

As the bill passed the senate it authorizes:

That persons engaged in the production of agricultural products as farmers, planters, ranchmen, dairymen, nut or fruit growers may act together in associations, corporate or otherwise, with or without capital stock, in collectively processing, preparing for market, handling and marketing in interstate and foreign commerce such products of persons so engaged. Such associations may have marketing agencies in common; and such associations and their members may make the necessary contracts and agreements to effect such purposes, provided that such associations are operated for the mutual benefit of the members thereof, as such producers, and conform to one or both of the following requirements:

First—That no member of the association is allowed more than one vote because of the amount of stock or membership capital he may own therein, or,

Second—That the association does not pay dividends on stock membership capital in excess of 8 per centum per annum; and in any case that the association shall not deal in the products of non-members to an amount greater in value than such as are handled by it for members.

What Makes a Desert?

By Dr. Ford A. Carpenter, Consulting Meteorologist

THE answer, of course, is scanty rainfall. But why is rainfall light on the southern portion of the Pacific coast of the United States, while it is very heavy on the northern section of the same coast? The difference in rainfall of 100 inches on the Washington coast and less than ten inches on the Southern California coast is mainly a matter of being within the track of the northern storm belt of the northwest coast, as both districts have equal proximity to the Pacific ocean. Then again, the very heavy rainfall of Washington and Oregon coast districts is intensified by the mountain ranges which compel the warm, moisture laden air from the Pacific to rise into a colder stratum of air. In studying the meteorology of the west coast of the United States one must always remember that the atmospheric drift is from the west to the east. Atlantic coast weather can never affect the Pacific coast unless the great atmospheric eddies which comprise storms move entirely around the earth. Weather always moves from west to east; never from east to west. To change this procedure it would be necessary to make the earth change its direction of rotation.

If the Pacific coast presented a flat surface to the prevailing westerly winds, the rainfall would steadily decrease with the latitude much the same as is the case in other regions of the world having the same latitude but without altitude. A contour map of the Pacific coast, especially one of the state of California, will immediately make plain to the average reader the reason for the diversified climates. The mountain ranges which parallel the California coast cause the upward flowing of the air currents from the Pacific to deposit their moisture and then continue their progress as drying winds. Thus deserts are made.

Arid portions of other localities of the world have mainly the same causes. The unwatered plains or steppes of Siberia, the Sahara, and

the great interior deserts of Australia, as well as the dry country on the west coast of South America—all are situated similarly in regard to the prevailing wind direction and the mountain ranges. Generous rains are characteristics of the north and south temperate regions of the earth. The regions about the equator have, extraordinarily heavy rainfall, caused by the moist air which is impelled upward by the great heat. The same strong upward air currents which cause the terrible thunderstorms over the equator are likewise responsible for what little rain there is on the desert. In the instance of the equator the air is moist and the condensation is very rapid, producing heavy and continued rains; whereas on the desert it takes a much higher degree of heat to carry upward sufficiently high into the cooler region of the atmosphere the relatively dry air. Only once or twice a year is an eastward moving storm sufficiently powerful to cause rain on a desert. Nothing that man can do will ever affect the climate of a desert, for the causes are earth wide. Man may "make the desert blossom like the rose" and render it otherwise fit for human habitation, but the desert climate is caused by such gigantic forces of nature that it is safe to predict that the same glorious sunrise and sunset colors, the dry, dessicating air, the brilliant sunshine and the regular ebb and flow of the aerial tide will remain the same ten thousand years from now as existed that many years ago.

FEDERAL ROAD FUNDS

Fifteen million dollars has been apportioned by the secretary of agriculture among 27 states, Alaska, and Porto Rico for the construction of national forest roads and trails. Of this sum \$9,500,000, known as the "National Forest Highway Fund," is set aside for roads of primary importance to states, counties, and national forest communities; \$5,500,000 constituting the "National Forest Development Fund" will be used for the construc-

tion of roads and trails needed for the administration and utilization of the forests themselves.

These appropriations will give a new impetus to the work of opening up vast tracts of valuable timber and areas of scenic beauty for the use and enjoyment of the American people.

The development of roads and trails throughout the forests will aid materially in fire protection. At present there are large areas of trackless wilderness within the national forests that can not be reached by trails. When lightning storms sweep over these inaccessible areas, heavy fire losses of public timber often occur.

California's portion of the national forest highway fund is \$1,460,871 while her portion of the national forest development fund aggregates \$703,822, making a total of \$2,164,693. The only state which equals California is Idaho which receives from the highway fund \$1,097,894 or a total in the two funds of \$2,186,550. Oregon is the only other state which receives more than a million dollars in the highway fund.

The total for the U. S. highway fund is \$9,500,000, while the development fund aggregates \$5,500,000.

SOME TRACTOR EXPERIENCE	
In December, 1918, we bought a tractor for use in our citrus groves and used it until June, 1921. A careful account of all the expenses incurred has been kept and also a record of every hour the machine worked. The results of these figures are summarized as follows:	
1919—Hours worked.....	1,150
1920—Hours worked.....	755
1921—Hours worked.....	192
Total hours.....	2,097
1919—Expense.....	\$1,268.20
1920—Expense.....	1,180.56
1921—Expense.....	194.14

Total expense.....\$2,642.90

The machine was used in working other groves in the neighborhood besides our own, and only actual working hours in the groves charged. In June we exchanged it for a new one of the same make, so we are able to figure the amount of depreciation, which was \$670.93. This item added to the expense bill of \$2,642.90 gives us a total operating expense of \$3,313.83. This includes the driver's wages of 50 cents per hour, and all other items except interest on capital invested, and gives us a per hour operating expense of \$1.58. We usually cultivated or disked between 20 and 25 acres of grove in nine hours.—E. L. Pollard, La Verne.

TRACTOR BELT WORK

The government has just completed an investigation among tractor owners in Ohio, Indiana and Illinois, showing the uses which 300 tractor owners found profitable for their tractors.

100 per cent use their tractors for plowing.

94 per cent use their tractors for fitting ground after plowing.

45 per cent use their tractors for cutting grain.

13 per cent use their tractors for loading hay.

5 per cent use their tractors for cultivating grain.

4 per cent use their tractors for seeding grain.

4 per cent use their tractors for drawing corn binder.

Less than 4 per cent use their tractors for any other operation.

Many tractor owners will have their threshing done by custom threshermen when they could be profitably utilizing the power of their own tractor if they owned a small thresher.

The same is true with their corn shelling. They do not use their tractor to operate an ensilage cutter because they have no silo as yet. They do not use their tractor to operate a wood saw because they have no wood saw. The same is true with many other belt driven machines.

Many of these tractor owners might purchase belt driven machines, thus making their tractor investment work more days per year, and saving time and labor.

"This Will Make 'em Grow"

"There's nothing like Hercules Farm Dynamite for blasting between the rows, George. We should have done this a couple of years ago. These trees would have been twice the size by now.

"We'll get the moisture around the roots this trip, though. This dynamite will make 'em grow."

POULTRY

Profitable Poultry News Just Received— Capacity 200,000 chicks, hence prices surprisingly low for quality. One recent order of County Farm Adviser's was 5,000 White Leghorn, 2,500 Brown Leghorn, 850 Red chicks. His orders are coming after two years' extensive trial of our chicks throughout his county. "Had the pleasure of seeing some your Anconas, White Leghorn pullets. They are grand." "Your Barred Rock chicks bought May, 1919, proved great winter layers. Had such good success with your chicks last year, am ordering again." These strains, 180-290 egg Leghorns, Rocks, Reds, Anconas, Wyandottes, Minorcas, Andalusians, ducks, turkeys, yearly lead many egg laying contests, supply foundation stock, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter laying, profit, guarantee. Booking for immediate future delivery, below pre-war prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 No. Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

Have you had satisfaction with your

BABY CHICKS?

If not, give us a trial. Our chicks give satisfaction.

SEEDS AND PLANTS

SUDAN GRASS SEED (The Great New Hay Crop) First introduced in the United States 1909 from Sudan, Africa. Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre. It grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. Pasturage. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1. 10 lbs. \$1.50; 50 lbs. \$3. 100 lbs. \$5; 500 lbs. \$35; 1000 lbs. \$50.

Details page 163 our new illustrated catalog 1200 bargains FREE. Just out. STROUT FARM AGENCY, INC. 831 ILL New York Life Bldg., Kansas City, Mo.

120 Acres Farming and Grazing Land, fenced and cross-fenced, 6 room house, barn and out houses, good well, ideal chicken ranch. 3/4 mile from town. Free mail every day, school bus runs by door, 60 acres plowed ready to put in. Price \$40 per acre, easy payments. This place in Cholame Valley near Parkfield, Monterey County. C. F. GOULD, 1032 Junipero Ave., Long Beach.

IRRIGATED FRUIT LAND

Fruit makes California the "Safe Farming" state. Irrigation makes fruit farming safe. We offer irrigated bottom land, best for big yields of fruit, at liberal terms. We have a real opportunity for you.

SUTTER BASIN COMPANY

304 California Fruit Bldg. Sacramento, Cal.

Level Unplanted Lands with Water, suitable for grape culture, \$300.00 an acre, 30 per cent cash, 10 per cent end of first year, 15 per cent end second year, 15 per cent end of third year, 15 per cent end fourth year, 15 per cent end fifth year. Fontana Farms Company, 406 Pacific Finance Building, Los Angeles.

For Rent or Sale—Good farm near Woodville, Tulare County. 8 acres 5 year old Thompsons pruned; 14 acres of alfalfa; 10 acres of 1 year Thompsons; 8 acres of raw land. Ranch is on Tulare-Porterville highway. Electric pump and pipe line. Sale price \$18,000. Address Box 366, care E. E. F. Willows, California.

Paradise, the Fruit Grower's Opportunity. Water, electricity, telephone, good roads, healthful climate. Write: C. H. Nielsen, Paradise, California.

For Sale—Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

TURKEYS

TURKEYS:—Purebred Giant Bronze.—Four famous Madison Square Garden winners heading this season's flocks:

GOLDBANK VIII, grand champion 40 lb. yearling cock 1921.

GOLDBANK BOY (his son) first prize cockerel 1921.

GOLDBANK KING, first prize cockerel 1922 (grandson GOLDBANK VIII and son of GOLDBANK IX, this year's champion first prize yearling).

COPPER KING'S BOY, third prize cockerel 1922; and COPPER KING JR., being grandson and son respectively of famous COPPER KING V, grand champion of 1913, that weighed 38 lbs. as a yearling. All mated to choice 20 lb. hens. Eggs in season; prices reasonable. Bronze King Farm, Route 2, Box 88A, Merced, California.

Points on Successful Turkey Raising. This seven page illustrated pamphlet tells about turkey raising in California. Contents: Breeding Stock, Setting, Care of Poults, Diseases of Turkeys, Stafford Turkey Hatcher, Stafford Feeding Chart. We rarely lose a poult and by using our methods you should have equal success. Price 50c. Satisfaction guaranteed. R. M. Dodge & Son, Route 2, Bakersfield.

Giant Bronze Turkeys, Gold Nugget strain have continually proven their superiority by winning Gold Special Sweepstakes at the West's greatest shows for the past seven years. Why be satisfied with any but the best? Sold out of stock for this year; can book orders for few more setting eggs. Address Blackman & Mumford, 607 East Third St., Los Angeles, Cal.

For Sale: Eggs from fine Bronze Turkeys, 35c each, or \$30.00 per hundred. Wright's Poultry Farm, Box 455, Elsinore, California.

Mammoth Bronze Turkey Eggs 35c, 50c, \$1.00 each. Fertility guaranteed. A few breeders left. Keys Ranch, El Monte.

Mammoth Bronze Eggs, \$25 per 100. Prize winning birds, 100 hens. Lone Star Ranch, Lankershim, California.

ROOFING MATERIAL

Roofing Paper—Firsts, complete with nails and cement. 1-Ply \$1.25; 2-Ply \$1.60; 3-Ply \$2.20. Lead and Oil Paint—\$2.20 a gal. Roof Paint Special—35c a gal. Prompt Deliveries on Mail Orders. ANGELUS ROOFING & PAPER CO. 764-766-768 So. San Pedro Street, Phone Bdway 5401 Los Angeles, Calif.

GOATS

For Sale—Highest class pure bred and grade Toggenbergs. Milk goats. La Corona Goats, El Monte, California.

For Sale—Goats: 800 Angoras, mountain raised, mostly young. Kidding April 1 to May 15. Registered sires. I. B. Putnam, Visalia, California, R. A. Box 284.

DUCKS

Mammoth White Pekin Duck Eggs \$1.00 per dozen, \$8.00 per hundred. A. Surtman, Petaluma, California.

HORSES

For Sale—Ten Horses, suitable for Farm, ranch or grading work. American Railway Express Company, Stables—551 Banning Street, Los Angeles, California.

Hogs Have "Flu"

We have some sows and gilts that seem all right when fed, but at the next feeding some of them refuse to get up and come to the feed with the rest. They reel when they walk and seem to be weak in the back across the kidneys. They shake at times as though they have a chill. They have lost their pigs. The one that has been sick longest still does not eat but seems to be improving. We feed only cooked feed. We get the bones and vegetables from the butcher shop and the garbage from one restaurant, but cook it all and always add salt to it. The green vegetables, such as cabbage, cauliflower and celery, are fed raw. What would you advise doing for them?—Subscriber, Taft.

When we get a report that hogs are sick and that they have been eating garbage our first thought is cholera, but the symptoms that you have noticed lead us to believe that in this case it is influenza. They should be kept dry and warm. Very little medicine is needed. You might put half a teaspoon of saltpeter in the feed once a day for each hog. Give very little feed but plenty of water to drink. Warm slop with little feed in it will flush out the system and relieve them quickest. Do not urge them to move about; they will recover quicker if kept quiet. Be sure they are in dry quarters and let in as much sunshine as possible but do not let the wind blow on them.

Now regarding the garbage. We would advise leaving that out for a time and bring them back to it gradually. Do not let the garbage get stale.

Warts

Would like to know what will take warts off a cow's teats. We have some that are so warty that we can hardly milk them.—Subscriber, Kern.

If the warts are long and have small necks where attached to the teats clip them off with a scissors and touch the spot with the end of a red hot wire. If the warts are flat and scaly wet them on the surface with nitric acid. Be careful in handling the acid as it is very caustic. Make a small swab about the size of a match; dip it in the acid and touch it to the wart. You may have to repeat this in a few days but often one application is enough. A strong solution of salicylate of soda applied once a day for a while to warts is said to prevent more coming and will usually cure them when they are not too large.

DEMERIT CARDS FOR FOOL DRIVERS

Chronic violators of the highway rules are to be rated by the Pennsylvania state police by means of punch marks on the registration card. Thus every motorist will carry his record with him. To the prosecuting attorney the card will be a ready exhibit. When punched full of demerits it would demote the motorist to the criminal class. As evidence it would rank with finger prints, and confound ten character witnesses. Speed hounds convicted by their own racing cards are not expected to applaud the innovation. Perhaps the police do not welcome the conductor's punch to their tool chests. Yet the plan may remove hazard from highways and spleen from the traffic. For the traffic officer may now make a little hole in a card with a gentle smile, instead of hurling forth epigrams that crack like whips. The public, probably, will prefer to have its villainy punched in than to have its ignorance bawled out.

"This setting down and folding our arms and waiting for something to turn up, is just about as rich a spekulashun as going into a four hundred acre lot, setting, down on a sharp stone, with a pail between our knees, and waiting for a cow to back up and be milked."—Josh Billings.

"Pioneer" Baby Chicks

We can now supply all kinds of baby chicks, baby turkeys and ducklings. We have served the public for sixteen years and are better fitted than ever to give you good strong profitable chicks. Safe delivery and full count of live chicks at destination Copyrighted guaranteed.

We also carry a complete stock of pullets, birds and cages, pullets, feeds and supplies. Pioneer incubators and brooders, also fireless brooders always on hand. Send for Price List. Visitors Welcome.

PIONEER HATCHERY
320 So. Pioneer St., Los Angeles, Calif.
"World's Largest Chick Dealers"

Holly Poultry Ranch

Hatching Capacity 200,000 Eggs
White Leghorn Chicks Only

Our customers contest which closed September 20, 1921, showed Farm No. 11 with 600 pullets hatched February, 1920, laid 217.99 eggs each, all in one flock. Can you beat this record?

We supply you stock bred for over 10 years for heavy production. Incubated in the finest hatchery with perfect ventilation. Chicks delivered in perfect condition by our two specially constructed and ventilated auto delivery cars; capacity, 15,000 chicks at one load; or packed for express shipment by an expert who had 15 years in the Express service. Can any other Hatchery or Breeder offer you such service and quality chicks?

Call and see our new **AIR WASHER SYSTEM**, bathing like it anywhere. Perfect ventilation. We are exclusive hatchers for spring of 1922, for F. B. Richardson, George J. Richardson, Charles O. Weaver, L. G. Hack, G. A. Saylor, C. W. Phelps, and George L. Miller; being this product of 25,000 selected breeding hens.

Agent for "Pride of Petaluma" Brooder Stoves. Our special Egg Turning Trays are now available for other hatcheries in quantity. Send for circulars.

B. R. HOLLOWAY
Box K. Van Nuys, Calif.

Poultry Stock

Specializing in White Leghorns from heavy laying strains of proven ability. Breeding, incubation, brooding and developing by most efficient methods known. Females ready when weaned from heat, hardened, and sex has been determined.

We start you right, either big or small, and save YOU TIME, MONEY AND WORRY. Write for prices, etc. Visitors welcome. Also fancy or general utility birds.

A Four Dollar Flock

By Jean A. Koethen

TIME was when a dollar a year was all the average hen was expected to bring her owner over and above feed costs. There are still hens that do no better but the average hen has doubled her value, and if she does not bring in two dollars with a year's work there is something wrong. The exceptional hen, however, or perhaps I should say the hen with exceptional care, can double this average and not overwork, and this is the case in the flock of A. W. Horswill of Pasadena, who last year netted \$1981.13 from 440 pullets. Still more remarkable is the record of Mr. Horswill's flock for the previous year. Six hundred and fifty-seven pullets hatched in the spring of 1919 began their pullet laying year, August 1, 1919, and between that date and October 1, 1920, cleared \$4.46 apiece.

A Satisfactory Laying House

Figure 1 (top photo) shows front of Horswill laying house. The front of the feed trough is seen through the wire. Figure 2 (bottom photo) shows end view of Horswill laying house. The upper roof is three feet above the lower roof.

This was in spite of a partial molt in the fall of 1919. In two years these 657 hens cleared \$4194.76 and then sold for \$156 more than it cost to raise them.

When the winners in the Holly Hatchery egg laying contest were announced last December Mr. Horswill was named as having cleared over \$4000 in one year with 540 pullets on two town lots. This looked too good to be true and brought letters of inquiry and protest from more than one Cultivator subscriber. "Is not this a misprint, and is it not \$400 instead of \$4000?" wrote one poultryman. "This report has created quite a little comment among poultrymen and outsiders in this section," wrote another, "and they, like myself, cannot quite understand how Mr. Horswill did it." As I had no particulars save the bare announcement which was made at the banquet I went to Mr. Horswill himself to learn just what had been done and how, and this is what I learned: The \$4000 was made with 1100 hens instead of only the 540 entered in the contest and on four lots instead of two. Mr. Horswill's residence and poultry houses pretty well fill the two lots he owns, and two adjoining lots are rented and fenced in for raising green feed and furnishing a run for the baby chicks. Even at that the record of his flock is a remarkable one, and his methods are worthy of careful study.

The 540 pullets in the contest averaged 176.86 eggs for the year ending September 30, 1921, and cleared \$4.02 apiece. But for the fact that the lot contained a number of pullets which had been sick in their infancy and should have been culled out the average would have been considerably higher. On the first of October, 1921,

lights were put on this flock, which had now been reduced to 440, and production jumped from 44 at the beginning of the month to 170 at its end. Average production in November was 9.70 per cent, in December 31.51 per cent, and in January 39.5 per cent. From this flock Mr. Horswill cleared in October \$85.25, in November \$192.83, in December \$120.04, and in January, \$107.76, or an average of slightly over \$100 a month.

How He Does It

It is a pleasure to talk to a poultryman who keeps as careful accounts as Mr. Horswill has kept. He knows at the end of every month just what his feed costs have been, what his profits are over feed costs, how many hens have been laying and their average production. He does not guess, he knows. When I asked him his secret he replied: "I live with my hens, I guess that's about all there is to it." No hen is kept over two years, and there is not a rooster on the place. He raises 600 pullets each year and keeps 300 of them through their second year. This gives him an average flock of 900, though occasionally it runs over, as it did last year, because the old hens were too valuable to part with. During the contest the flock contained 600 hens and the 540 pullets in the contest, and it was these 1140 hens and pullets that netted over \$4000 during the year.

No-Yard House

Mr. Horswill's houses are built after a plan of his own devising and are quite "different." Figure 1 shows a portion of the front of one. The plan is similar to that known as the "semi-monitor" as is shown by the end view in Figure 2. The space between the upper and the lower roof is covered with canvas in order to provide more complete ventilation than is permitted by the open front. The covered portion at the extreme right in Figure 1 contains the drinking fountain. The house is 20 by 40 and accommodates 400 hens. Mr. Horswill believes that hens which are always confined have more fresh air and better protection from the weather in this house than in the common shed roofed structure.

Nests and feed trough are built along the center of the house, the nests being about two feet from the floor on the inner side of the supporting timbers, and the feed trough one foot from the floor on the other side. The slats through which the hens eat are horizontal instead of vertical to prevent crowding. Wire stretched through the middle of the house above the nests keeps the hens from crossing back and forth above the feed trough. The house is 9 feet high at its highest point, 5 feet high in front and rear and 6 feet from floor to canvas ventilator.

Feeding the Layers

The mash which is kept before the layers constantly consists of 700 pounds bran, 240 pounds shorts, 300 pounds feed meal, 300 pounds hulled barley meal, 300 pounds Croley's high protein beef scrap, 100 pounds ground bone, 100 pounds medium charcoal and 25 pounds salt. The scratch feed until recently consisted of hulled barley, milo and Kafir. Now cracked corn and wheat have taken their place and are fed half and half. The mash trough is refilled each morning on the theory that what is left from the day before has been picked over so thoroughly that it is no longer well balanced. At 10 A. M. sprouted barley is given, 10 to 12 pounds of the barley before sprouting being allowed to 400 hens. At 4 P. M. the scratch is given, 30 pounds being allowed 400 hens. This makes each hen's allowance of mash a little more than of scratch and barley combined. If the hens are laying heavily their allowance is a little greater. When they do not eat up their mash their allowance of scratch grain is reduced. Green feed is fed shortly before roosting time and after the greens when a little encouragement is needed, a moist mash made of cooked vegetable parings and onions thickened with the mash feed is given. Biddy eats the scratch first, then the greens, then the moist

mash, and goes to roost with her crop bulging.

Mr. Horswill does not believe in the moist mash as a steady diet but finds it of great value when production be-

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus Bacterium Pullorum transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: I have raised poultry for years and have lost my share of little chicks from White Diarrhea. Finally I learned of Walker's Walko Remedy for this disease, so sent for two 50c packages to the Walker Remedy Co., Dept. 596, Waterloo, Iowa. I raised over 500 chicks and never lost a single one from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor—they develop quicker and feather earlier. I have found this company thoroughly reliable and always get the remedy by return mail. Mrs. L. L. Tam, Burnetts Creek, Ind.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 596, Waterloo, Ia.

This damper regulates your check draft and the direct draft to your fire.

Queen Brooder Stoves

will burn coal, coke, wood, or briquets. The only safe and reliable method of brooding chicks. Queen stove has patent draft that controls heat perfectly. Write for catalogue, also ask for general catalogue of full line poultry supplies.

Mt. Lowe

MILE HIGH WONDER TRIP \$2.50

Pacific Electric Railway

gins to lag toward molting time or when he wishes to force the layers to their utmost. Promptness at feeding time is a rule which is never broken.

Electric Lighting Important

The high records of the past two years have been made under lights. On the first of October the clock which turns on the lights is started and the lights go on at 4 A. M. After about a month the clock is adjusted so that it gains a minute a day. When the short days of December come the hens find themselves getting up at 3 o'clock. After Christmas the clock is adjusted to lose instead of gain, and the hens are worked back to their normal hour of getting off the roosts. No lights are used at night unless the weather is very dark, when they are turned on to keep the hens off the roosts till their regular roosting time.

Weeds for Greens

No special crop is planted for greens. The two lots which supply green feed are watered frequently and copiously, and the natural wild growth, which in Pasadena is mainly alfalfa and malva, is cut for the chickens. Mr. Horswill says his hens prefer alfalfa to alfalfa, and judging by results it does just as well.

Raising the Chicks

In February or early March 1500 chicks are purchased and brooded around a Kresky stove in a house 16 by 24. Last year the brooder house contained only a single room from which the chicks had access directly to their run. This year a playroom 16 by 14 with cement floor has been added. The floor of the brooder room is covered at first with sand and later a layer of straw is added. The first feed is rolled oats. Chick feed is given the second day, and after a couple of days more a mash of bran, shorts, corn meal, bone meal and beef scrap is placed before the chicks. The mash is similar to the regular laying mash with the exception that it contains more bone meal than beef scrap. At first the chicks are allowed only in the small run adjoining the brooder house, but as soon as they have learned to take care of themselves they are given the run of the two vacant lots. At the age of 3½ months they are moved to the laying house.

Poultry Queries

Conducted by Jean A. Koethen

10,000 Dozen Eggs

In the issue of the California Cultivator of December 31 on page 673 Mrs. Koethen wrote an article which carried the heading "10,000 Dozen Eggs from 600 Hens." That article referred to Mr. Horswill's record made on two town lots where 540 hens "cleared the neat little sum of \$4,000 in one year." Mrs. Koethen's report brought in many inquiries as to just how it was done. Mrs. Koethen has investigated more fully and has written an article giving details and making correction as to number of hens and size of the plot of ground. That article appears in this department this week.

Successful Turkey Venture

"I am very much interested in your articles on turkeys," writes a Fallbrook subscriber. "A neighbor had to sell her day old turks last year on account of sickness and I bought them for 50 cents each. I raised 53 of the 60, then three were accidentally killed when ready for market. I kept the ten best hens and a tom and sold the remaining 39 at 35 and 40 cents a pound, clearing \$213.45 above all expenses. I had no conveniences at all and must build a brooder house as soon as I can. I have 50 young turks now ready to go on range, hatched November 30 to December 15, and have surely had a busy time caring for them through these long rainy spells."

A woman who can raise 88 per cent of her turkeys without any equipment is doing wonderfully well. I have asked this subscriber, Mrs. Fleming, to tell us how she fed them and shall hope to publish this interesting bit of information before long.

Tail Feathers Gone

About 30 of my 50 young White Leg-

horn hens have lost nearly all their tail feathers. Their tails are quite bare and sometimes bloody, as if they had been picked. The hens seem to be in good condition otherwise. Is this a disease?—Subscriber, Julian.

Tail picking is a vice, not a disease. In some cases lack of sufficient meat in the ration seems to be the cause; in others, the hens get a taste of blood through some injury to one of their number and take to picking tails to satisfy this craving. If you are feeding a good laying mash there is presumably no lack of animal food, but you might give them green cut bone once a week if it is available or add a little high grade beef scrap and bone meal to the mash. Remove from the flock every hen whose tail is bloody just as soon as you notice it.

How Soon Fertile?

A goose which has been laying was never mated till now. How soon will the eggs be fertile?—Subscriber, San Gabriel.

Fertility may be expected in from one to two weeks after mating. Eggs have been found to be fertile as early as four days after mating, but fertility cannot be counted on much under two weeks.

Covering Cracks

I am making a barn into a hen-house. Can you suggest some way of covering the cracks in the floor?—Subscriber, Napa.

Ordinary batten strips would cover the cracks nicely if they are not too wide. If you do not care about looks you might try tacking strips of beaver board over them. Lath would do very well for small cracks. What you use must depend on the width and evenness of the cracks.

Charles Weeks House

Please tell me if there are any Charles Weeks poultry houses in Gardena or vicinity. How do these houses compare in cost with other houses where birds are kept in large flocks?—Subscriber, Lomita.

The first Charles Weeks house I ever saw was at Gardena. I presume you will find quite a number there by this time. The house costs a little more per bird, I believe, than the large flock houses, but not a great deal. It is hard to compare costs exactly because there are so many types of large flock house and more than one of the small flock house.

Hens Roosting in Trees

In your issue of March 4, on page 253, was a query by a Napa subscriber regarding hens roosting in trees. For the benefit of that subscriber and any others interested I would like to give my experience with hens that slept out all winter. We have 120 hens which were hatched at Petaluma on June 15. As we were in our first year of farming we had not sufficient housing accommodations for them, and from the time they were able to fly up to the trees about half of them roosted out. Later, when we had prepared a house for them, we were unable to drive them in at night. All through this winter they have roosted in the trees, even during our heavy frosts, hailstorms and snow. Despite this they began to lay before they were six months old, and we noticed from our egg record that they laid more heavily in wet weather than in dry. The day following the snowstorm these 120 pullets, only seven months old, laid 82 eggs. During February they laid a total of 184 dozen eggs and are now laying eight dozen a day. Yet our feed bills are a great deal lower per hen than those of friends who keep theirs housed. And we have had absolutely no sickness in the flock.—Mrs. N. M. Perry, Lincoln.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, February 28, 1922.

Report for seventeenth week ending February 27: The hens in the contest are holding the stride they struck more than a month ago. Last week they picked up another 200 eggs over the average for the same period for the last seven years. This means that at the end of the four winter months, the period of high priced eggs that are hard to get, these hens have exceeded

What is your pumping problem?
Perhaps your pumping conditions are ideal for this simple, high-efficiency pump.

If so, you can make a substantial saving in your power or fuel costs.

Our engineering department will carefully study your pumping problem (if you will let us know what it is) and faithfully recommend the right size and type of pump for your work. Absolutely no charge for this service.

STORRS EGG LAYING CONTEST

(Continued from Page 309.)

their expected lay by a margin of 3,000 eggs. It seems fair to assume that the average yield of 35 eggs per hen for the first four months constitutes satisfactory winter production. At any rate as hens go it is much better than the performance of the average farm hen. On this basis the following table shows the number of birds in each breed in the contest, the number of eggs they have laid in the four winter months and their index number of relative rating during this period:

Birds	Eggs	Rating
Leghorns	400	13,039 93
Locks	260	8,544 94
Teds	240	8,739 104
Vyandottes	100	4,664 133

Total.....1,000 34,986 100
The pen of Barred Rocks owned by E. Dennison, from East Lansing, Michigan, that won first place last week, was again at the head of the

list with a score of 57 eggs in the seventeenth week.
The four leading pens in each of the principal breeds are as follows:

Plymouth Rocks

Seven Hills Farm (Barred), 579; S. Bradford Allyn (White), 564; Harry G. Culver (Barred), 518; H. E. Denison, 478.

White Wyandottes

Frank P. Matteson, 696; Woodbridge Orchards, 679; Walter Bradbury, 604; Clemens J. Diemand, 596.

Rhode Island Reds

The Orchards, 588; Applecrest Farm, 562; F. S. Chapin, 551; Charles H. Lane, 524.

White Leghorns

Goshen Poultry Club, 561; Hollywood Farm, 485; L. E. Ingoldsby, 483; Small's Poultry Farm, 475.

Turn Your Clods into Dollars

The CUNNINGHAM PULVERIZER

Smashes clods, breaks crust, knocks down ridges, closes cracks, makes perfect seedbed, saves 1/3 seed, forms a mulch, stops evaporation, preserves moisture, saves irrigation. Works close to trees, increases crops 30%, makes it easy to procure prune pickers—every farmer, orchardist, vineyardist, nurseryman and seedman should own one. Hundreds in use. Write for circular.

California Plow Co. 140 Polhemus Street
SAN JOSE, CALIF.

U. S. MOTORS

California Irrigation Type
To Operate in Hot Temperature
Without Power Loss

No kind of service imposes such a severe test upon a motor as irrigation. Operating continuously night and day throughout the irrigation season and in high temperatures necessitates the selection of a motor with rugged stamina.

U. S. Motors are 40 degree motors and their super-cooling efficiency enables them to operate at full load in high temperatures without strain or stress or overheating. We produce an irrigation type that is meeting the needs of California irrigators admirably. Request literature.

U. S. Motors are built in horizontal and vertical types to meet any pump power needs. Sizes from 1/2 horse power to 125 horse power and larger.

Coast Tires

WEAR DEFIERS

COAST TIRES are making good on their **SERVICE**

Every day we receive enthusiastic letters from users who find that Coast Tires are money-savers because they give more mileage.

As one dealer expressed it: "They are made right; the quality is there, and they stand up better than any tire I know of. Every Coast Tire I sell makes a friend for my business."

You may be interested in reading what some of our customers say about them:

A Record Made on the Lava Roads of Hawaii

ROYAL HAWAIIAN SALES CO.
Limited

AUTOMOBILES, TRACTORS AND
ACCESSORIES

Honolulu, T. H., Sept. 13, 1921.

Coast Tire & Rubber Company,
Syndicate Building,
Oakland, Calif.

Gentlemen:

The information given below may be of interest to you, and it may possibly help your advertising campaign:

"Up to the morning of September 10th, a 34x4½ Coast Cord had traveled exactly 7,319 miles, on the rear wheel of a Hudson Super-Six Rent Car, which travels daily between Lahaina and Wailuku on the Island of Maui, T. H., a distance of some 22 miles each way, over one of the roughest roads on the Island. (When we say 'roughest' we mean that the tire had to travel over seven miles of mountainous road, which is nothing better than loose rock.)

"Two weeks before this tire was applied to said Hudson car, another brand of Cord tire was put on the opposite wheel, and blew out at 5,177 miles. The tire was completely worn out. From the latest reports the Coast Cords should see better than 9,000 miles, as the tread and carcass are in perfect condition. No stone cuts appear on tread."

One might say that this is an official test made under the auspices of the Royal Hawaiian Sales Co., Ltd., Territorial Agents for Coast Cords.

Very truly yours,
ROYAL HAWAIIAN SALES CO., LTD.
By E. W. Burgess, Tire Department.

Stand Mountain Roads

Oakland, California, Oct. 14, 1921.

Coast Tire & Rubber Company,
Oakland, California.

Gentlemen:

I have used Coast Tires on my Chalmers car for more than a year and have found them the most satisfactory tires that I have ever used in every respect.

Last March I placed two "Coast Cord" tires on the rear wheels which have gone over 5,000 miles, and which includes two trips across the Sierra Nevada Mountains as well as over some of the worst roads in the State, yet they show very little wear and have never been off the car.

For long wear and service I do not think there is a better tire made than your product.

Very truly yours,

NBC:MN

N. B. CAMPBELL.

Non-Skid Qualities

City of Portland, Oregon
Department of Public Safety
Geo. L. Baker, Commissioner
Bureau of Police

May 24, 1921.

Coast Tire and Rubber Company,
Oakland, California.

Gentlemen:

In response to your inquiry regarding the service we are getting from the Coast Tires which are being used on my official car, I am glad to say that I think this tire has wonderful non-skid qualities, and is therefore of special value to us.

We have had an opportunity to give these tires a good trial during the recent bad weather conditions when the streets were very wet much of the time, and I feel that I can conscientiously recommend the Coast Tire.

Yours very truly,

L. V. JENKINS,
Chief of Police.

Mayor of Oakland Likes Them

CITY OF OAKLAND
California
JOHN L. DAVIE
Mayor

September 8, 1921.

Mr. Holmes Ives, President,
Coast Tire and Rubber Company,
52nd Avenue and E. 12th Street,
Oakland, California.

Dear Sir:

I am sending you these few lines in appreciation of the splendid service which I am receiving from the Coast Tires.

Early in this year my official car was equipped all round with your tires. They have given and are giving splendid service. My car is subjected to difficult strain and covers territory of every description—highways and mountain roads.

I am highly pleased with the record of performance made by your tires and wish to congratulate you on the fact that a home industry produces a product of such excellence.

With my best wishes for the development of a very successful business, I am

Very truly yours,

JOHN L. DAVIE,
Mayor of the City of Oakland.

It will pay you to give Coast Tires a trial. There are hundreds of Coast Tire dealers on the Pacific Coast, but if there should be no dealer in your vicinity, we will be pleased to send you prices and complete description of our tires. Write to

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers; nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTE

Orchard and meadow, hillside and big oaks as they are in San Diego County are shown on the cover. Thousands of such scenes are given to him who will drive by the inland route to San Diego. Nor is San Diego County alone in this possession of wonderful scenery for, drive where you will, in California, there is a beautiful valley or mountain or seashore, in fact, just California.

The University of California reports the enrollment of 204 in its agricultural correspondence courses.

It is estimated that the campaign to control citrus canker in Florida has cost over \$2,000,000 for control measures and over \$11,000,000 more in value of nursery and orchard trees destroyed.

The National Milk Producers Federation of Washington is making a campaign in favor of the Voigt bill (H. R. 8086). This bill prohibits the movement of imitation milk in interstate commerce. Imitation milk is, by the way, sometimes termed oiled milk.

It is composed principally of skim milk to which is added some measure of vegetable oils.

POWELL MEMORIAL

There was a great outpouring of citrus fruit growers, of Californians, and even of representatives of America, in the service in memory of G. Harold Powell. Highest tributes were paid by Herbert Hoover and many other speakers, who came and spoke of the efficient and willing service rendered by Mr. Powell.

W. H. HEILEMAN

The California Farm Bureau Federation has lost its staunchest worker. Since its organization its secretary-treasurer has been W. H. Heileman. His sudden death occurred last week. The information comes to us in a personal letter from President W. H. Walker. Dr. Walker writes:

"It is with the deepest regret that I announce to you the death of our friend and secretary, W. H. Heileman. I feel that we have all suffered a distinct loss, which will be felt throughout the farm bureau movement of the state and nation. The only compensation that I see we can find is for each person with a little more zeal and with that loyalty and faithfulness exemplified by our friend to strive to carry on the work and bring to a success that which he has been instrumental and successful in beginning. I trust that some plan may be worked out whereby we may perpetuate his memory and show appreciation of his work, in, if possible, establishing a fellowship which would give an opportunity to develop and educate students to carry on this line of work which was so dear to Mr. Heileman."

NEW COLLEGE HEAD

The board of regents of the University of California has announced that Professor C. B. Hutchison of Cornell University has been selected to head the Northern branch of the College of Agriculture, University of California. The appointment is one of the steps inaugurated by the regents to develop at Davis a college of agriculture in keeping with the needs of this state.

Professor Hutchison was born and reared on a Missouri farm, and following his graduation from the College of Agriculture of the University of Missouri he accepted a place on the faculty of that institution and was a member of the staff of the agronomy department until 1916, when he became professor of plant breeding at Cornell.

He is regarded as a leader among the younger men in college work. Since his student days his work has been of a notable character, and he will bring to California an exceptional training, backed by a sound viewpoint that comes as a result of intimate contact with agricultural problems that is sure to enable him to become a constructive factor in the agricultural affairs of this state.

Hutchison succeeds H. E. Van Norman, who was dean of the university farm school and vice director of the experiment station and who is now president of the World Dairy Congress. It is expected that Hutchison will assume his new duties about April 10.

BUILD BOULDER DAM

The conference held in Phoenix failed of accomplishing all that was hoped for. Hoover presided and ap-

pealed for harmony and for fairness on the part of all. He also appealed for a disposition to give and take that the future of the Southwest might not be jeopardized because of selfish desires of delegates of any of the states. The upstream folks are still insistent that they own all the waters originating in their states. They ignore the fact that years before any of these Southwest states were states the federal government entered into treaty with Mexico, by which the American government recognized Mexico's rights to certain waters of the river. Regardless of this, Colorado and one or two other states are renewing the old state's rights question settled in the awful bloodshed of the Civil War. Of course, they can never make such claim stick in any American court. Of course, those delegates know that to be the case, but at the same time it appears that they are going to continue to press the claim in order to delay and embarrass the lower basin states which are demanding instant action because of the menace to Imperial Valley and other lands which are already partially developed.

However, the conference closed with positive assurance by Mr. Hoover that "Boulder Canyon Dam will be built, and that soon." When Secretary of the Interior Fall was here a few months ago he made a similar statement. So it is a reasonably safe conclusion that this dam will soon afford relief to the Imperial Valley. In addition to Boulder Canyon, other dams at Bull's Head, San Carlos and The Sentinel on the Gila River were urged.

In order of importance the three great steps to be taken on the Colorado are: First, flood control; second, irrigation; third, generation of hydroelectric power. The first and third of these steps will be taken in the building of Boulder Canyon dam. In addition, more effective irrigation will be possible. Speaking of the necessity for immediate action in flood control Wm. Mulholland of Los Angeles said:

"Down yonder in the corner of California is a great inland empire, over which hangs the danger of a calamity worse than that of the San Francisco earthquake or the Chicago fire, because if the river ever breaks through its levees down there and overflows Imperial the loss to posterity will be irreparable because the land can never be restored.

"Nothing can be lost by taking steps to prevent floods in Imperial Valley. That is a thing which demands speed. Facts can be made any time. In my time I have carried through some monumental projects the legal phases of which are not yet settled. We spent \$24,000,000 dollars to build the aqueduct, had one lawyer on the job and suffered no lawsuits, neither did we despoil anyone."

MORE HOPEFUL

John Perrin, chairman of the board and federal reserve agent of the reserve bank at San Francisco, takes a most hopeful view of agricultural market conditions. In his recent summary of the monthly report he says: "Prices for most of the principal farm products of this district have risen materially since the first of the year. Wheat, wool and all kinds of livestock benefited particularly, as did also the citrus fruits, but the latter at the expense of damage by killing frosts and winds estimated as high as 50 per cent of the anticipated crop. Commodities such as barley, rice and cotton which did not participate in the general rise

are nevertheless at prices comparing favorably with those of a year ago. Since a large part of last year's crops is already out of the farmers' hands the recent rise in prices will not operate primarily to increase returns to producers. It is significant, however, in its bearing upon returns to be received from crops now in the ground. That the increased prices have, however, resulted in considerable marketing of products would appear from the condition reports of the 66 reporting member banks in the principal cities of the district."

FRUIT INSPECTION

Quick and satisfactory action has been secured by the effort of the fruit shippers to secure release of fruits under inspection at the eastern end. H. H. Warner went to Washington as a representative of California citrus fruit shippers and called attention to the long delays which seemed necessary at the eastern end. The federal department has now ruled that fruits inspected and passed by the California state department of agriculture shall not be required to pass other inspection by federal inspectors at the eastern end. This will mean many days quicker delivery. It likewise means recognition of the efficient work of the California state department of agriculture. Of 2,000 cars of California oranges shipped this season only 23 have been held by the chemistry division of the federal department of agriculture on account of deterioration by frost.

SIGNING UP THE ALMONDS

The campaign of the Almond Growers is proceeding magnificently. The almond growers are of a class who can see the necessity of cooperation if the almond industry is to be preserved. The arguments required are few, and several communities are endeavoring to make it "100 per cent in the Exchange." It is to be hoped that 4,999 of the 5,000 almond growers of the state will be on the inside.

It is assumed by one of the biggest and most powerful banks of the United States that the campaign will be a success for the management of the Exchange announces it has a letter from the National City Bank of New York, in which it offers aid in plans to stabilize the almond growing industry of California and the extension of a line of credit. Manager Tucker writes: "Nothing better could be said in support of the new five year crop agency contract."

THE SALES TAX

There seems to be a willingness on the part of some members of congress to vote a soldiers' bonus and then saddle the cost quite largely upon the farmer. The sales tax plan has been heartily condemned by every farmer and heartily commended by those in other callings who are anxious to escape taxation made necessary. This government is rich enough to reward those who suffered from the hardships of war, and it should do it without putting an undue burden on any one class. But differences of opinion as to taxation should not prevent us from performing our duty to those dependent on one who gave up his life for his country or to those who were incapacitated because of their service. There has been a measure of help given along these lines but it should be more liberal.

Imperial Valley Grapefruit Problems

By Robert W. Hodgson

ACCOMPANIED by the newly appointed citrus extension specialist, W. R. Schoonover, and Farm Advisor E. L. Garthwaite, the writer recently had the pleasure of spending three days in Imperial County in a survey of the rapidly growing grapefruit industry of that part of the state. As is the usual experience in a new district, the growers are encountering many problems which to the majority are entirely new and perplexing to say the least. The present article is prepared in the hope that it may contain suggestions of value to those having orchards already planted and particularly to those expecting to set out grapefruit within the near future.

Contrary to first reports which indicated that the recent freeze had occasioned little or no injury to the grapefruit plantings of Imperial County, it was observed that in some of the new orchards there was considerable splitting and cracking of the bark and in the older orchards in a few isolated sections the outer fruit had suffered to a considerable extent. In one or two orchards it was apparent that 30 to 40 per cent of the crop had been frosted. On the whole, however, the orchards were found in very good condition and the amount of frost injury was much less than the average occurring in the main citrus districts of the state.

Soils

It is generally agreed that the best orchards are on what are known locally as the soft soils, ranging from fairly light sand to sandy loam. Considering the lack of rainfall and the large amount of silt carried in the irrigation water it seems advisable to limit plantings to lighter soils where ample drainage is provided and where adverse physical conditions may not

be expected at least for many years, and though occurring, may be satisfactorily met by proper tillage. For those orchards already planted on the heavier soils the growing of deep rooted leguminous cover crops, such as *Melilotus alba*, is recommended as a means of opening up the subsoils to deeper penetration of moisture. Care must be taken, however, not to injure the trees by the application of too much water and also to see that the cover crop and trees do not compete for water.

Some orchards were found where considerable quantities of alkali salts occur and others where the water table is within four feet of the surface. The grapefruit cannot be expected to grow successfully under such conditions.

Stock

Although a comparatively new district it was observed that in the older plantings there is a considerable percentage of off-type trees which emphasizes the great importance of planting only those known to be propagated from the best type of Marsh Seedless. The thought naturally occurs that it would be a good practice to select buds from the best yielding trees and orchards in the valley for purposes of propagation as trees grown from these buds would naturally be expected to do better than trees propagated from buds taken from districts dissimilar in climatic and soil conditions. Good orchards exist in the valley from which such bud wood might be taken.

Because of deposition of silt in irrigation it cannot be too strongly recommended that trees be budded high in order to prevent brown rot gum disease. Special care should also be

taken to set trees with bud unions well above the surface of the ground. A number of cases were observed where brown rot had seriously injured the trees. In every instance the trees were found to be planted too deeply and had the bud unions covered. The prevalence of gum disease seems also to be connected with the general practice of flooding. Furrow irrigation would seem more advisable.

Planting

On account of the extreme climatic conditions occurring during the growing season special precautions seem advisable in methods of planting. The balled tree seems to be in favor as against the loose rooted tree on account of reduced danger from drying out of roots in handling. Orchards were seen, however, where trees had been planted by the loose root method and where the percentage of loss had been less than five per cent. Many growers seem to favor the balled tree, however, even though more expensive, considering the extra expense to be good insurance. Where balled trees are used it is recommended that the balls be worked up well with the soil in which the trees are planted, several orchards having been seen where the soil composing the ball was of markedly different character from that in which the trees were planted with the result that the trees have failed entirely or done only indifferently.

Where the ball is composed of heavy soil and the trees are to be planted in a light soil the ball should be broken and mixed well with the soil. Where the balls are composed of light soils it seems advisable to remove the sacking. Natural rainfall being either lack-

ing or scanty, it is especially desirable that the soil be wet well before planting.

Early planting was stated to be almost a necessity, the favored month being March. It would seem, however, that where given extra care planting might well be done later. Several orchards planted as late as May, even with bare rooted trees, showed splendid results. A prevalent method of planting is filling holes with water and setting trees directly in the water, resulting in the heavier soils in a puddled condition. On the lighter soils this practice does not seem to occasion any unfavorable results, but in the heavier soils it is not recommended. Special care should be taken to firm the soil about the roots, after which irrigation should be given. On account of the high evaporation the young trees should receive water about every ten days for the first season.

In orchards where trees of good stock were secured, planted properly, and well cared for the trees were found to have made a remarkable growth. Indeed it was hard to believe that trees stated to be six and seven years of age were not in reality ten or twelve years old judging both from size of the trees and amount of crop. All doubt has been removed as to the bearing qualities of grapefruit in the Imperial Valley, eight year old trees the past season yielding from ten to 14 packed boxes of fruit.

Frost Protection

In the establishing of grapefruit orchards in the Imperial Valley, protecting the trees against frost injury for the first two or three years will undoubtedly prove insurance well worth while.

Strawberries in the Pajaro Valley

THE Central California Berry Growers' Association has proven a great help in saving at least a part of the small fruit production business for the white man. At the annual meeting of this association there were addresses touching upon various phases of strawberry culture, and one delivered by President Eaton of the association reviewed a bit of the history of strawberry growing in that great producing section, the Pajaro Valley. We are permitted to quote from President Eaton's address as follows:

By O. O. Eaton, President Central California Berry Growers

About the first strawberries in the Pajaro Valley were planted near the Gilky place, near Vega Station, in Monterey County, by Mr. Marchant in 1865.

Louis Martinelli planted on what is known as the Phelan place in 1867 and soon after planted berries on the Capelli & Dondero place. Berries were raised on a small scale and could hardly be sold, there being only the local market.

In 1875 Mr. Ceschi and Messrs. Capelli & Dondero, as partners, bored wells and used windmills as a means of obtaining water for irrigation.

In 1879 the Watsonville Water Company provided water for irrigation purposes as a means of disposing of their overflow, thus making it possible for the more extensive growth of the business and broadening the market to San Francisco and elsewhere.

However, James Waters started shipping the Cinderella berry grown on the Blackburn place in 1877 to the San Francisco market, Mr. Blackburn doing the same with a few that he planted the same year.

In 1878 Ira Thurber followed closely in the footsteps of Messrs Waters and Blackburn by also shipping to San Francisco, there being all told 14 acres planted to strawberries this year. The berries brought a splendid price, the lowest \$11 per chest, and nearly all bringing \$20 per chest of 100 pounds net.

In 1881 there were 42 acres; in 1882 45 acres; in 1883 118 acres. At this time Waters & Brewington and McNelly began to plant, and the increase in acreage was rapid. In 1884 there

were 185 acres. That year Stewart, Buckley & Thurber leased the Lake Farm, commenced grading and planted about 30 acres. My father, R. W. Eaton, also started in this year. In 1885 the acreage was 268, Stewart, Buckley & Thurber having planted 100 acres.

About 90 per cent up to this time were Cinderella, then the Parry began to be planted. In the season of 1886 there were shipped from all sources to the San Francisco market 1,500 chests daily, many selling for \$1 per chest.

In 1887 there was an acreage of 344; in 1888, 354; in 1889, 257; in 1890, 275.

During 1890 the Malinda began to be planted, and in a few years all or nearly all were of this variety. In 1891 the acreage was 289, in 1892, 272 acres. Up to this time, with the exception of the Lake Farm and the Menker places, there was no pumping for irrigation. Waters & Porter put the first pumping plant on the river. The planting increased until in 1895 there were 522 acres, and it remained about the same until 1900. In 1901 there were 700 acres; 1902, 840; 1903, 800; 1904, 700, and 1905, 670.

Up to 1894 the package used was

the chest of 20 slides, five pounds of berries in each slide, or 100 pounds of berries in each chest, and no baskets. In this year the need of a smaller container was seen, so a few of the slides were cut in half and the berries placed in the half slide without baskets.

In 1890 a two pound basket was placed on the market but, due to the prohibitive price of \$15 per thousand, did not come into universal usage until 1892, when the price was reduced to \$10. Two of these two pound baskets fitted the slide, allowing a net content of four pounds to the slide, thereby reducing the net content of the chest to 80 pounds. This two pound basket remained in favor until 1910, when a few growers placed a few early berries in small half pint baskets, six to the slide, again further reducing the net content to 50 pounds per chest. The growers found the reduction in net weight of berries per chest so profitable that by 1912 the half pint basket was being universally used.

In 1918 the state department of weights and measures began to take an active interest in the amount of berries placed in the baskets and is-

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County holds a road bond election, March 25.

Tractor extension school will be held on the old fair grounds at Santa Rosa, April 24-29.

A snow white gopher was caught last week on the Zumwalt ranch near Chico, Butte County.

The California Rice Growers Association has made sale of 20,000 bags of rice at \$2.60 for No. 1 paddy.

Noel Negley, state dairy specialist, has taken charge of the Sonoma-Marin pure bred dairy bull campaign.

R. W. Myers, apiarist of Colusa County, shipped over 20 tons of honey last week to Los Angeles. He has about 500 stands of bees.

Colusa Indians are busy with the salmon run which has just commenced. Fishermen average 25 cents a pound at the express office.

Through the efforts of the county farm bureau several school grounds in the Sonoma Valley will at once be planted with trees and shrubs.

Horticultural Commissioner Flournoy of Tehama County says citrus trees in that county were not seriously injured during the recent cold snap.

Santa Rosa's Rose Carnival committee has plans well under way for the celebration in May. C. O. Dunbar is chairman of the general committee.

The Capay Valley, Yolo County, Almond Growers Exchange has approved the new five year contract of the California Almond Growers Exchange.

Northern California Elks will gather at Santa Rosa, May 25, for a special session at which Luther Burbank, the noted plantsman, will be initiated into the order.

Shasta County's old court house was sold by the supervisors to the McCloud parlor of Native Sons for \$1. The Native Sons will preserve it as an historical relic.

The Antelope Almond Growers Association of Sacramento has adopted new by-laws providing for the five year crop delivery contract now asked by the state association.

More than 40 farmers near Red Bluff, Tehama County, took a special farm management course given there by representatives of the state university, beginning March 16.

The farm school at Davis will hereafter be known as Northern Branch of the College of Agriculture of the University of California. It will now be in charge of a director instead of a dean.

Paving operations on the Red Bluff-Redding state highway discontinued for two winter months, have been resumed. The 14 mile stretch from Red Bluff to Cottonwood is completely paved.

Members of the California Bankers Association, representing 22 Northern California counties, in session at Sacramento, endorsed the proposed five year contract between the almond growers and the California Almond Growers' Exchange.

Establishment of a central agency to coordinate colonization moves in Northern California and to advertise the state's land and its program for helping men to own farms is advocated by Dr. Elwood Mead of the University of California.

Central California

Five thousand apricot trees are being planted in the McFarland district of Kern County.

More than 30 varieties of grapes are being grown and tested by Merced County farm adviser.

Delano, Kern County, is sending out carloads of lettuce. Prices received are \$3 to \$4 per crate.

May 25 is the date for signing up hogs for contest to be decided at the Turlock Pork Day October 4.

The Madera County branch of the California Cattlemen's Association met at Coarse Gold, March 11.

The Tulare River Citrus Association last season shipped 44,227 boxes of fruit. Average payment \$3.10 per box.

The farm center at Chowchilla, Fresno County, has decided to give wives of members the voting privilege.

The J. W. Guiberson Company of Corcoran, Kings County, reports sale of 50 bales of Durango cotton at 20 cents.

The railroad feeding the Don Pedro dam works was damaged by the storms so that work was suspended for a time.

The Tulare Cooperative Poultry Association marketed in February 1000 cases of eggs, paying members 23 cents for No. 1.

Fertilizer experiments are being carried on by the growers service department of the Sun Maid Growers on 172 separate plots.

More than 300 dairymen of Merced and Stanislaus Counties attended the dairy meeting held recently at the Noxem ranch near Newman in Stanislaus County.

The Magnolia Citrus Association has been formed by growers of the Porterville district of Tulare County. A packing house will be built in time for the Navel season.

President Walker of the state farm bureau says that the farm bureau marketing exchange has already contracted with farmers for nearly 100,000 tons of grain, mostly barley.

Stanislaus and Merced Counties will celebrate Pork Day at Turlock, October 4. Ten farm centers of the two counties will join in arrangements, committees meeting April 26 to form plans.

To prevent the possible spread of mealy bug and citrus white fly in Kern County the Tevis ranch at Stockdale has been placed under plant quarantine by the Kern County horticultural commission.

Miss Clark of the university extension service has been giving demonstration in food preservation in Fresno County. It is planned to form a home economics department in the farm bureau there.

Ten million grape vines and cuttings came into Tulare County from outside nurseries during the month ending February 24, according to monthly report of county horticultural commissioner.

"For the first time in years," says the Kerman News, the Kerman district of Fresno County is an importer instead of an exporter of alfalfa hay. Alfalfa fields have been replaced by Thompson Seedless vineyards.

Southern California

A 1500 acre vineyard is being planted at Perris by F. Weinberg.

El Centro, Imperial County, has opened a farmers public free market.

Perris poultry raisers report thousands of chicks and turks in electric brooders.

A meeting of the California Walnut Growers Association will be held in Hemet today, March 25.

State Market Director Maddox has been talking cooperative marketing to Ventura County farmers.

The Los Angeles farm bureau directors are asking members to post membership signs on their farms.

The Pure Bred Breeders of Southern California are planning a big pure bred sale for Imperial Valley.

Bruce Drummond of the U. S. date gardens at Indio gave date pruning demonstration at Meloland, March 7.

Several officials of Los Angeles and San Diego went to Phoenix to attend the session of the Colorado River commission.

Dr. Fawcett of the citrus experiment station will conduct several field demonstrations on treatment of walnut melaxuma.

The Santa Barbara County farm bureau has invited the Walnut Growers to hold its next field day in Santa Barbara County.

Experiments with the use of fertilizer on alfalfa are being tried out by Assistant Farm Adviser Ellis of Imperial County on the Cooke ranch west of Brawley.

Citrus growers of Pomona, San Dimas and La Verne districts have secured reductions in Los Angeles County tax assessments because of frost damage.

The Southern California Horse Show Association has been organized under direction of Marco H. Hellman of Los Angeles. A show will be staged at Los Angeles April 12-15.

At the recent annual citrus institute at San Bernardino during the National Orange Show it was decided to turn over this activity to the farm bureaus and agricultural extension service.

Farm bureau meetings in Los Angeles County: Burbank, March 27; Little Rock, 28; Downey, April 3; Glendora, 3; Alhambra, 4; Zelzah, 5; Lankershim, 6; Whittier, 7; San Fernando, 7.

A big land slide in the Cajon pass covered one-eighth mile of Santa Fe tracks. In some places the track was twisted and undermined. Trainmen say "the mountain simply slid down on the tracks."

Congressman Phil D. Swing has succeeded in putting through congress his bill to make a national monument of Palm Canyon near Palm Springs in Riverside County. The reserve will include 1,600 acres.

A California wide campaign to stamp out what is termed "medical bootlegging" will be launched at the convention of the California State Homeopathic Medical Society at Santa Barbara May 10-12.

More than 250,000 grape vines already rooted in the Rockwood section of Imperial Valley were taken out and burned because they had not been dipped in hot water as prescribed by the state department regulations.

The Coast and General

Range in southern Arizona is badly in need of rain.

International Livestock Show at Salt Lake City, April 3-6.

Over 20,000 bounties were paid last year by Idaho on predatory animals.

The Douglas County farm bureau is making a determined effort to obtain a state experiment station for the Umpqua valley of Oregon.

The premium list of the Oregon state fair shows cash awards totaling more than \$75,000. The fair will be held at Salem the week of September 25.

The Oregon Mint Growers Cooperative Marketing Association recently held its annual meeting at Corvallis. Directors meetings will be held at Albany.

Rice growers of southern Texas have been studying the California plan of marketing crops and are discussing forming a rice marketing branch of the farm bureau.

The increased yield of cows on association test in Oregon during January of this year over that of the same month a year ago averaged 2.35 pounds butterfat per cow.

"Better homes for Oregon" was the slogan of the homemakers' conference held at Oregon agricultural college, Corvallis, this week. Better homes were pictured in lecture, demonstration and exhibit.

The Columbia River Highway, Oregon's famous scenic route, traversed every year by thousands of tourists from all parts of the country, is again open for traffic after having been blockaded by a December storm.

Horace Porter of Riverside talked on the Colorado River project at Tucson, Arizona, March 7 on invitation of the Association of Engineers and Rotarians. This is the first of a series of meetings for discussion of the project.

By refusing to allow grazing privileges for sheep whose owners have failed to comply with dipping regulations, forest officials, cooperating with state and federal inspectors, hope to stamp out scabies among central Oregon sheep this year.

The Lane County, Oregon, Jersey Breeders Association is planning a tour of Jersey farms in the county. At its recent annual meeting at Eugene T. O. Green of Coburg was elected president; Frank Taylor of Thurston, secretary-treasurer.

Ranchers of Haines, Oregon, report hundreds of squirrels coming from their holes and making their way to the light through several inches of snow, thought to be a result of long continued winter weather which has caused their food supply to become exhausted.

The Washington state farm bureau federation has gone emphatically on record in favor of an absolute long and-short-haul clause to prohibit the railroads from charging more for a shorter haul to interior communities than they charge for the longer haul to the Coast cities.

U. S. weather bureau at Phoenix reports: "A deficiency in temperature for the past two weeks has prevented the warming of the soil necessary for the successful germination of seed and farmers as a rule are refraining from planting until there is a decided change to warmer; some are irrigating in anticipation of the desired change."

THE following brief outline covers the main points gleaned from the experience of our most successful growers:

Preparation of Seed Bed

The most important factor we consider, in making plantings of alfalfa, is the proper preparation of the seed bed. A very deep plowing followed by any irrigation, then thoroughly disking by disking, harrowing and raking, and in case where the soil is very heavy and would work up rather badly the use of a cultipacker would have it in nice, loamy condition. One should at all times keep in mind the importance of working the soil just as soon as possible after irrigation in order to retain the moisture as close to the surface as possible.

Time of Planting

The best time of year to plant alfalfa is during the latter part of September and up to the middle of October. At this time of year most of the weed seeds are lying dormant in the soil and the alfalfa will come up and cover the ground, and although not making much of a top growth, will establish a good root system so that when the warm weather comes on and

an irrigation is given the vitality of the plant is such that it will make a very rapid top growth. However, if it becomes necessary to follow up a crop that matures very late in the fall or winter with alfalfa, necessitating a spring seeding, we would advise planting during the first to the middle of February. This date, however, applies to Arizona conditions. In some parts of California where cold weather prevails longer in the spring, March or April will possibly be the best time.

Method of Seeding

One of the most important things to consider is the method of planting, and the one we consider the best requires the use of an alfalfa seeder or grain drill with an alfalfa seed attachment. By the use of this machine less amount of seed per acre can be used and can be placed in the soil at any depth required in order to reach moisture. Another thing is the depth of planting. In light or sandy soil seed

should be planted at a depth of one to one and a half inches, whereas in heavier soil we would say one half to one inch. There are a good many opinions as to the amount of seed required in order to secure the best stand. Our policy, however, has always been to govern ourselves entirely on the quality of the seed used, planting only the highest grade at the rate of fifteen pounds per acre. Seeding as heavy as indicated will make the plants break through the soil uniformly and will cover the ground quicker and shade out the weeds which are likely to come up at the same time, especially if planted in the spring.

Irrigation

Alfalfa should never be irrigated after it is planted until it has completely emerged and has at least attained a growth of from four to five inches in height. This procedure will

force the root systems to make a stronger and deeper growth whereas an irrigation immediately after planting would germinate all the foul weed seeds and would have a tendency to hold back the growth of the plant caused by the soil packing very tightly around the stems of the new growth stopping circulation of both air and moisture. With an application of water at the time suggested the plant is well established and able to make a rapid top growth. Young alfalfa requires more frequent irrigations the first year than in years following, depending entirely on the nature of the soil, whether light or heavy, light soil requiring at least one more irrigation per month than soil of a heavier type.

After a good many years of close observation we find that an irrigation of say a week to ten days prior to cutting the alfalfa for hay will allow the plant to make a rapid growth immediately after the crop is removed and completely cover the ground before another irrigation is necessary. Follow with water again in two weeks' time, and then again as stated before, a week prior to cutting. This gives about two irrigations per cutting.

Subsoiling the Walnut Orchard

BEFORE taking into consideration any practice of soil handling, whether in the walnut orchard or elsewhere, it is pertinent that consideration be taken of the nature and composition of the soil in general and the soil of the walnut orchard in particular. We should know something of the life processes of the soil, how the soil lives, how it eats, drinks, breathes and does its daily work.

We may compare the soil to a complex laboratory wherein there are many stones, some large, some small, covered with water, interlaid with masses of undecayed vegetable matter. In and about is a liberal circulation of air containing nitrogen to be used by the nitrogen gathering bacteria in the nodules of leguminous cover crops. And scattered throughout are the small workmen (bacteria) attacking this organic matter which is made by cover crops and manure applied to the soil, tearing it up and changing its form to combine it with salts of the soil so that the roots may take in this material as food.

The body of the soil is made up of rock fragments interlaid with the organic matter, and the space between the fragments is known as pore space. This is an area wherein is found the air and water of the soil. In the average soil 50 per cent of the volume is pore space, and for optimum conditions of plant growth approximately one-half pore space is water and one-half air. To facilitate operations man has devised tillage. It has been found that tillage admits air into the soil and air is indispensable to the roots. One has only to look upon the grove that has been flooded with water too long to see the results of the exclusion of air. Oxygen contained in the air is also most necessary in the decay of organic matter. Furthermore, air carries nitrogen to the nitrogen fixing bacteria which live upon the roots of leguminous cover crops.

Soils have a very definite breathing process in which temperature changes are very important. An increase of one degree Fahrenheit will drive from one cubic foot of soil one cubic foot

By Eugene S. Kellogg, Horticultural Commissioner of Santa Barbara County, Before Fourth Annual Walnut Growers Institute at Santa Ana

of air, and the reverse happens when the temperature falls. During periods of low pressure tremendous quantities of air are expelled from the soil, while during periods of high pressure the air reenters the soil.

Tillage makes plant food available. The small organisms depend upon the optimum supply of air and water for their work. In tearing down the organic matter carbon dioxide is formed as a waste product and this gas is also given off as a waste product in animal life. The carbon dioxide combines to form carbonic acid and a chemical action is then set up on the rock fragments, changing their nature and making them over into soluble salts, an ever renewing source of food for the plants. So that when we say that the soil needs a rest, we really mean that the soil needs a period of time for this chemical and bacterial action to make available plant food for use at some future time.

Tillage is also very necessary for the saving of soil moisture in that it prevents surface runoff. It also prevents surface evaporation by forming a mulch and breaking up the capillary system which carries the water from the soil to the air.

Tillage extends the feeding area of roots and breaks up the soil, so that the roots may penetrate into the hitherto impervious recesses of the soil.

Tillage improves the physical condition of soil. We know that there is a difference between a microscopic soil particle and a clod of soil. When soil is wet it runs together in a mass and when broken up by tillage it crumbles. This condition makes what we call a good condition of tilth.

The property which causes particles to cling together into compound particles when dry is known as cohesion and is due to certain cementing materials. In the arid regions these are chiefly salts or alkaline materials of various kinds. Irrigation water often

dissolves and causes the amount of salts to become excessive, or irrigation water may itself carry too heavy a load of salts. It is readily seen that there is need for deepening our tillage operations to allow a deeper penetration of these salts. Thus by increasing the volume of the amount of salt remaining constant the density of the solution is made less.

Where irrigation is not practiced there is commonly not sufficient rainfall to grow both cover crops and mature the walnut crop and clean culture is customary. Organic matter is constantly being used up and unless it is replaced the loosening effect of this matter upon the soil is constantly being lost. Furthermore, the sun striking the organic matter of the soil causes it to be burned out, and the result is that the soil becomes harder to handle and tends to run together when wet and must be broken up deeply to allow the penetration of water and air.

The walnut is a deep rooted tree. You have probably heard of the man somewhere in Southern California who wrote a letter to his missionary friend in China, advising him that within a few days he could expect the roots of his walnut trees in Southern California to penetrate the crust of the earth on the opposite side and asking his friend to kindly turn the roots over and start them back to California. At any rate it is a fact that the roots of the walnut penetrate deeper than those of any other orchard crop, and it is very obvious that our tillage operations should be correspondingly deep.

In view of the fact that both irrigated and unirrigated groves need a deeper tillage a number of growers in Santa Barbara County took up the idea of opening the soil to a greater depth than had been done by using a subsoiler. Probably 50 per cent of the acreage in the Goleta Valley was sub-

soiled during the past season. Various types of subsoilers were used; some had mold board plows which were converted by using a special type of chisel on the beam in place of the shear. Most of these proved too light for heavy use, particularly in heavy soils. A beet plow was shown to be admirably suited for the work, and of course a regular Killefer made for the purpose was very successful. When converting old plows a two or two and a half inch point is generally used. Most of the work is done with tractors. On an average type of soil the subsoiler could not be put down to much more than a foot without running in low gear.

The first subsoiling began in the season of 1919 when P. C. Marble, manager of the Santa Barbara County Walnut Growers' Association, subsoiled some land of a clay nature. He broke up the ground to a depth of 18 inches, running his furrows about two and a half feet apart both ways. This land was rather sloping and during the following winter there was practically no runoff. In previous seasons the runoff had been excessive. At the next harvest there was an increase of about one-third in the yield of beans. Having such good results in the bean ground, Mr. Marble in 1920 subsoiled a 20 acre walnut orchard. Furrows were run at intervals of two feet, 16 inches deep, most of the orchard being subsoiled only one way. The subsoiler was not run nearer than eight feet to the trees. The soil was plowed very deep in the spring. The 1920 crop of this 20 acres was eight tons. The 1921 crop, which was generally light in the vicinity, was 11 tons. This orchard is not irrigated.

In another orchard Mr. Marble had an interesting experience in the penetration of irrigation water. Formerly it required 24 hours for the 11 inches of water delivered at the pump to reach the ends. Eight furrows were used. After subsoiling it required four days for this head of water to reach the ends in the same number of furrows, the water being run in the subsoil furrows.

Save \$200 to \$2200!

Over one hundred designs in the new Aladdin book

Get the New Aladdin Book of Homes

You cannot afford to make a decision on building before getting a copy of the Aladdin Book of Homes. The message it contains for home builders means you can save \$200 to \$2200 or more by building an Aladdin. You can secure a more attractive home, a better floor plan and besides Aladdin makes it possible to buy all the material guaranteed to be sufficient for the home—no extras except masonry. One hundred beautiful, practical, comfortable homes are pictured and described with the floor plan for each home. Send for Aladdin Catalog No. 641 at once.

Sold Direct—No In-Between Profits

The Aladdin Company is the greatest home building institution in the world and it does not sell through dealers. It manufactures the lumber at the edge of the four greatest timber-producing states. It prepares the house complete, ready to be shipped direct to the home builder. You save the dealers' profits. Your carpenter nails the readi-cut lumber just like in any other first-class, permanent home. The catalog explains the details fully.

Bungalows, Dwellings, Summer Cottages

Aladdin prices include all the timbered framework, millwork, the siding, outside finish, porch, shingles, windows, doors, interior woodwork, lath, glass, nails, hardware, lock sets, paints, stains and varnish. Send today for Catalog No. 641.

after the last storm in the grove of Chester Rich. There has always been a considerable wash coming down from the lands of a neighbor, which very often gullies Mr. Rich's orchard. This year during the rain a dam was constructed across this wash and the water diverted to the subsoiled orchard. Here it rapidly disappeared from sight and was taken into the soil completely without damage. In fact, a considerable amount of water was stored in the soil which would have been wasted.

After the recent rains a number of holes were put down with the soil auger to determine penetration of moisture. The average penetration in unirrigated groves after seven inches of rain had fallen was two feet four inches in ground which had not been subsoiled. In the bottom of the subsoiled furrows there was an average penetration of three feet two inches, while an average penetration between the subsoiled furrows showed a penetration of two feet eight inches. Two days ago the same relative depths still were found, there being a penetration of about six inches greater in the subsoiled groves than in adjoining groves not subsoiled. However, recent storms, which were very gentle in Santa Barbara County, would not be as good a test as a hard torrential rain where there would be a tendency for excessive runoff.

We sometimes hear it said that subsoiling in an orchard is injurious because it cuts off roots, especially the fine feeding roots. As for the larger roots, it is generally conceded that if they come within 15 inches of the surface they should be cut off or they will sooner or later interfere with proper tillage. As a matter of fact, very few feeders will be cut off because they generally grow more or less in a vertical position and the subsoiler at intervals of two or three feet may break off a few of them, but generally passes on through without molesting them. Then, too, it is a question if any harmful results would follow inasmuch as these feeder roots are always cut off when the orchards are plowed as deeply as it seems necessary that they should be. And when the soil dries in the fall these feeders die, anyway. No one has as yet proven that any ill effects have followed this operation, and until the fact is proven I do not believe that any particular stress should be laid upon this point.

It is not my opinion that subsoiling is a cure all on all types of soils. I believe that it is entirely unnecessary on very sandy soils where the physical condition is ideal, and even in soils that are harder to handle, I believe that subsoiling in some cases at two year intervals would be more economical than subsoiling every year. Present indications would point to this practice as being very beneficial in heavier soils that have become puddled through handling while wet, soils with a salt or alkali content brought about by use of irrigation water, soils that have lost their good physical condition through burning out of humus in clean culture and subsequent failure to add organic matter. However, the practice of subsoiling should be investigated further and results carefully noted in order that more information may be had before arriving at any definite conclusion.

STRAWBERRIES IN THE PAJARO VALLEY

(Continued from Page 315.)

sued a regulation to the effect that half pint baskets must contain eight ounces of strawberries and pint baskets 12 ounces. This brought about an increase of ten pounds of berries to the chest and immediately brought about the proper filling of the baskets which heretofore had contained from six to seven ounces.

In 1917 the legislature passed a

Fresh fruit and vegetable standardization law which defined a deceptive pack as "any package having on exposed surface fruits, berries or vegetables which are so superior in quality and appearance to the balance of the package as to materially represent the entire contents," made it a misdemeanor to ship, for sale or sell a deceptive pack. The county horticultural commission and the state commission enforced act and soon found that it was not impossible to place on the market half pint basket of strawberries, was not packed deceptively.

In view of these facts, in July, the association passed a resolution adopting the pint basket for strawberries, having well in mind the fact that all chests and slides would be set aside and a free crate. During the fall of that year growers contracted for 7,000,000 pint baskets to handle the 1920 crop. During the lull period the growers found that they could ship a pint basket in the old slide and by using 16 slides in a chest, in place of 20 as before they could use their old chests. However, some growers preferred not to do this, for the reason that the baskets shaped for this slide brought a new basket on the market, caused more confusion among the basket manufacturers, these growers preferred a square top basket, the one then becoming commonly used throughout the state. The growers went through the 1920 season in more or less confusion owing to many different packages.

Growers who preferred a square pint basket placed in a tray shipping their 1921 crop in this manner, after advancing into the season with very much success, showing berries off to good advantage. A representative of a fruit concern in Paso, Texas, while in San Francisco was attracted to this package, and the result was that on May 12 a telegram was received from these El Paso people asking for a car of berries. May 25 the first car went forward. May 30 another, and one on the way to Los Angeles, containing trays. These 2,568 trays, or 321 chests were picked on a day preceding a day or, in other words, on a day we can do no picking for our San Francisco and Oakland markets. On Friday, May 28, a telegram was received in San Francisco from Los Angeles asking for a car of berries to be shipped at once, as the rains had demoralized picking conditions leaving the market without berries. Owing to these growers using trays it was possible to act immediately, as quick action was necessary to take advantage of this condition. The first car as mentioned went forward Monday, May 30, another Tuesday and still another Wednesday. Their orders being countermanded wire as local growers could then supply the demand.

In the very peak of the season, from May 21 to June 21, 16 cars of berries were diverted from the San Francisco and Oakland markets, at a time when the market absolutely needed berries. While these growers sustained a loss on some of these cars, that does not alter the fact that those berries that were left for the San Francisco and Oakland markets were then highly benefited by the removal of 16 cars.

The eastern fruit buyers, through their San Francisco representative were so much interested in the package as to offer us a price that enabled us to ship a car on August 1 to Chicago. This being the first shipped east, we naturally all went with great anxiety. However, the eastern people wired for further cars and they had received 33 cars for Chicago and one for New York.

Promising Treatment for San Jose Scale

By A. L. Quaintance, United States Department of Agriculture

WHILE the bureau of entomology believes that thorough spraying with dormant tree strength of lime-sulphur will control the San Jose scale, yet to meet the desire of orchardists for other treatments a number of experiments with sprays were undertaken. The purpose of the present article is to call attention to results secured in the treatment of the scale by the use of a spray containing one per cent lubricating or engine oil emulsified with potash fish oil soap.

The careful experiments in Florida by W. W. Yothers with various sprays for the control of citrus scale insects (the orange white fly, as published in Farmers' Bulletin 933, resulted in a formula of engine oil spray which has been found remarkably effective. A view of the small amount of oil used, namely, one per cent, emulsified with potash fish oil soap. Mr. Yothers found that any one of several oils of the lubricating type, when thoroughly emulsified and used at the dilution indicated was quite effective against these scale insects and the white fly, and these sprays have now come into large commercial use in Florida.

The surprising efficiency of a spray containing such a low percentage of oil suggested the desirability of testing sprays of this character against San Jose scale. The abundance and destructiveness of the scale in the Bentonville section of Arkansas and the desire of growers for other lime-sulphur sprays has offered an excellent opportunity for testing various dilutions of engine oil sprays against this pest. The experiments were carried out by A. J. Ackerman in the office of deciduous fruit insect investigations and have included tests of lubricating oils of a strength of one-half per cent to four per cent or five per cent, thoroughly emulsified with potash fish oil soap. The tests showed practically complete eradication of the scale by one thorough application of the spray of a strength now as two per cent of oil. Orchardists have been so pleased with results that the two per cent oil spray will be extensively used in their present necessity of bringing the pest under subjection.

It is a point yet to be established in connection with the present experiments as to the possible injury of the oil spray which may result to the trees, twigs or buds, and several seasons' experience will be necessary before a decision on this question can be reached. In view of the experience in Florida in spraying citrus trees in which with one per cent of oil, it is found that dormant deciduous trees will stand without injury one and a half per cent treatment containing two per cent of oil.

In order that entomologists who desire to do so may make tests of the present treatment available to orchardists who may wish to test it on a small scale, the following directions for making the stock emulsion are given:

Formula for Stock Emulsion

Engine oil, or oil of similar viscosity, 1 gallon; water, 1/2 gallon; potash fish oil soap, 1 pound.

The oil, water and soap are placed in a kettle and heated to a boil. As the scum appears on the surface

of the mixture as it first begins to boil. After boiling for a few minutes the brown scum begins to disappear and at this stage the kettle is removed from the fire and the entire mixture is pumped twice under pressure of about 60 pounds while still very hot. A proper emulsion can not be made by stirring nor should the mixture be allowed to cool before it is pumped. Too much pumping will often break up the emulsion. During pumping, ordinary pump packing is burnt up rather quickly by the hot oil mixture. For making the stock emulsion on a large scale an all metal pump would be necessary.

The stock emulsion contains 66 2-3 per cent of oil. To make a two per cent emulsion for use in a 200 gallon spray tank it is necessary to use 6 gallons of the stock emulsion.

Precaution should be taken to prevent the stock emulsion from freezing, which occurs at a temperature of about 15 degrees Fahrenheit.

In case difficulty is experienced in making a proper emulsion, due to hardness of the water, the water used should be softened by the addition of 1 pound of caustic soda or lye per 100 gallons of diluted spray. The caustic soda should be dissolved in 2 or 3 gallons of water and then added to the spray tank and thoroughly stirred, after which the proper quantity of stock emulsion can be added.

Any one of the following, or similar oils, may be used, some one or more of which can doubtless be obtained in most parts of the country: Diamond paraffin oil, 180 red neutral, Jr. red engine oil, Nabob oil.

EUSTIS LIMEQUAT

A new citrus variety, known as the limequat, is coming into prominence and is being listed by several nurseries in Florida. The limequat was produced by the United States department of agriculture in the course of various experiments in hybrid citrus fruits by crossing the West India lime with the kumquat orange. The hybrids possess the hardy characteristics of the kumquat, and while not as resistant to citrus canker as the still hardier kumquat it is satisfactory in resistance and can be recommended, especially for home gardens.

The fruit is very much like the lime in quality and flavor and can be used in "ade" drinks in the same way. Moreover, the rind of the limequat, like that of the kumquat, is edible, so that the whole fruit may be utilized. The color is light yellow resembling that of grapefruit.

Budding experiments on different stocks are in progress, and the present indications are that the limequat will thrive on any of the stocks commonly used except the sour orange. Like the lime, if planted low and mounded with soil the limequat bud will strike its own roots, thus simplifying the stock question. The fruit is borne at the most desirable time, during the hot summer months. Limequat promises to become a valuable addition to the list of citrus fruits.

NO ADVERTISING SIGNS IN CALIFORNIA FORESTS

Advertising signs in the 17 national forests of California must come down, following an order issued by the district forester at San Francisco on January 27. Advertisements printed on rocks and trees are also to be effaced. According to the regulations of the forest service of the United States department of agriculture, such advertising is prohibited in all national forests without special permits, which are seldom issued. The object of this regulation is to prevent defacing of the mountain landscapes of the national forests with billboards and other unsightly signs.

NEW DIVISION OF EXTENSION WORK

L. H. Goddard, a farmer of Fayette County, Ohio, has been named by Secretary Wallace to head the new division of projects and programs of the office of extension work of the states relation service, United States department of agriculture. He assumed

his new duties February 20 and will have charge of work intended to aid in formulating and carrying out those features of the extension program having a national or broad regional significance, and with administrative matters pertaining to the projects, plans of work, budgets, and expenditures under the federal laws relating to extension work.

Wishing for sleep is a poor way to get it

A LITTLE wisdom in the daytime is a better assurance of rest than any amount of anxious wishing when nerves are a-jangle at night.

What you do at noon often has more influence on sleep than what you want and hope for, at midnight.

Coffee's drug element, caffeine, whips up the nerves, and when its use is continued there's usually a penalty which no amount of mental effort can avoid.

The part of wisdom, as so many thousands have found, is to turn away from nerve-stimulation and adopt rich, delicious Postum as the mealtime drink. Postum delights the taste, but brings no disturbance to nerves or digestion. Even the little children can share in the enjoyment of Postum at any meal.

It's better to anticipate warnings than to be driven by them.

It's better to encourage and preserve sound nerves and complete health than to listen to the clock ticks at night and say, "I wish!"

You can get Postum wherever good food or drink is sold and served. An order today may be the beginning, for you, of the great satisfaction and comfort which so many others have found in Postum.

Your grocer has both forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes.

Postum for Health "There's a Reason"

Made by Postum Cereal Co., Inc.
Battle Creek, Mich.

MOTTLED ORANGE LEAVES

There are different kinds of mottled leaves, from distinctly different causes, and all mean sick trees. Send or bring leaves and new growth and I will locate your trouble.

A Pump without lubrication troubles

No lubrication troubles because there are no under-surface bearings to lubricate. The only lubrication required in the New Bean Turbine is in the head, where a radial thrust bearing operates in an oil bath. We have eliminated all drive shaft bearings through improved construction. The advantages of this construction are at once apparent.

Built in All Sizes from 6-inch up

The Bean Turbine goes into a bored well—or into your old pit, if you have one. It is suspended entirely from the surface—and can be easily removed when desired.

Efficient—Economical

This pump develops surprising efficiency and delivers the maximum of water at the minimum of cost. Requires little attention and the heavy substantial construction insures long and satisfactory service.

Send the coupon for Turbine Pump Bulletin—also, ask for catalog of Horizontal Pumps, if interested.

Frost Damage to Apricots

By A. H. Hendrickson, Mountain View Experiment Station

MOST fruit growers have observed that there is more injury caused on apricots by a frost when tree is in blossom or setting fruit than by a low temperature of similar severity and duration when the tree is wholly dormant. They have also perhaps noticed that the young fruit becomes more tender as the season advances. This last fact is contrary to what would naturally be supposed from outward appearances. In appearance the blossom with its delicate parts would seem to be more tender than the fuzzy young fruit surrounded and somewhat protected by the dead calyx, or so-called husk. Yet most growers would be surprised if told that injury from frost and lack of set is often caused by frosts late in the season rather than during blossoming or shortly before.

The reason for tenderness, as the season advances, is due to the low concentration of the sap in the tissue of the young fruit. Pure water freezes at 32 degrees Fahrenheit, while salt water freezes at a point several degrees lower. Similarly, within the cell in the sap there are materials, chiefly in the form of sugars, which tend to prevent the freezing of the sap until the temperature is several degrees below the freezing point of pure water. Generally speaking, the more concentrated the sap, that is, the more sugars and similar materials it contains in solution, the lower will be its freezing point. Hence cells with thin watery sap freeze more quickly than those with a more concentrated sap. It often happens that the temperature falls low enough to injure the former cells without hurting the latter. If a majority of the cells of a given part of the plant are frozen, that part usually dies or at least is severely injured, while if a comparatively small number of cells are frozen recovery usually follows.

Rate of Fall of Temperature

During the fall and winter months the cells in the twigs of the apricot are filled with concentrated sap. No injury follows the ordinary frosts because the sap is not frozen. The twigs and leaf buds of the apricot are fully as hardy as of the peach and are able to withstand much lower temperatures than are ordinarily experienced in the apricot districts of California. The early blossoming season of the apricot, however, restricts this fruit to a much narrower range than the peach. As the bright days of late winter begin to warm up the apricot buds, certain activity in the cells causes the sap to become less concentrated or more watery and therefore more easily frozen. Consequently temperatures only a few degrees below freezing are injurious at this time when the same temperature a few days or weeks earlier would have done no damage.

In the process of freezing the water of the sap is removed from the cell and forms ice crystals in the intercellular spaces. This leaves the protoplasm or jelly like material in the cell dry. The more water that is removed from the cells the drier the protoplasm becomes. As water from the roots cannot be conducted upward fast enough to replenish that being withdrawn to the intercellular spaces, certain changes take place in the protoplasm which result in the death of

this substance. If the frost is a one only a small amount of water withdrawn from the cells and injury may not occur. If the protoplasm when the tissue thaws is able to take up water as it moves back into the cells.

Certain studies have shown that amount of injury by a given low temperature varies with the time of year, condition of plant, rate of temperature fall and rate of thawing. The first of these has been discussed in the preceding paragraph in which it was pointed out that danger from frost usually increases with the advance of the season from blossoming time until the danger of frost is past. Weak and poorly nourished plants and those having a thin watery sap are frequently more severely injured than those in which the sap is concentrated.

Fall Frosts Not Harmful

Trees having concentrated sap are those which we usually speak of as having mature wood and well developed buds. The rate of fall of temperature is one of the most important factors to be considered in a discussion of frost injury. It has been repeatedly observed that there is no injury from excessive cold when low temperatures occur suddenly late fall or early winter. Yet the same temperatures in other years reach after an interval of more moderate weather are not nearly so serious.

Gardeners "harden off" cabbage and tomato plants by exposing them to cool temperatures for short periods before removing them from the hot house to the field for the same reason. Frost when apricots are in blossom coming after a succession of warm days, is often more injurious than of the same severity following a cold weather. This has been observed several times with almonds at the University farm at Davis. Plants seem to become adapted to cold weather when the change is gradual and are able to stand lower temperatures than when the change is abrupt.

The amount of injury following a frost is thought by some observers to be influenced by the rate of thawing. Less injury is believed to occur when the thawing is slow, due to clouds, smoke, or more when the temperature is quickly raised by the unobstructed morning sun. This view is general among orchard men and so investigators, although Dr. W. B. Chandler of Cornell University by a series of careful experiments found much injury followed where the thawing was gradual as where it was rapid. The foregoing factors are all of importance when the frosts are not severe, but if the temperature goes low enough buds, blossoms and fruit are killed regardless of the rate of fall or the rapidity of thawing out.

First Theories of Smudging

Heating orchards and vineyards was not a new practice. Early books on horticulture recommend burning straw on frosty nights to form a blanket of snow to prevent radiation of heat. The same idea prevailed when the first systematic attempts at smudging were started. A dense cloud of smoke was deemed the essential factor. This proved ineffective as the saving of heat thus effected was entirely too small to prevent the temperature from reaching the critical point.

Other devices, such as irrigating

ward before a frost was expected, laying trees with water, and the use of fans for stirring up the air, all proved impractical. The first methods relied upon addition of heat due to use of comparatively warm water and the increase in humidity which would tend to prevent radiation. Not enough heat, however, could be added by running water in the irrigation furrows to combat serious frosts and crops were often lost when dependence was placed on this means of frost protection. Spraying trees with water is not effective and sometimes causes breakage by formation of ice on the branches. As frosts usually come on quiet nights when the warm air is displaced by the cold air flowing down from the hills and settling in the low places, windmills and fans have been tried for setting up air currents which would tend to mix the air and prevent any of it from getting cold enough to cause injury. This was also not feasible because of the immense volumes of air it was necessary to move.

The only remaining method of combating frost in orchards is the actual conduction of heat to the air by burning coal, wood or oil. Coal and wood are no longer used to any extent, having been displaced by oil which is more convenient and easy to handle. The usual type of orchard heater in deciduous orchards of California is the open or lard pail type. A number of growers are installing improved stack type heaters which throw more heat and burn the oil more efficiently. The usual number of heaters is approximately one in each square acre, surrounded by four trees, with a double row around the outer edges on the windward side. The lard pail type in use has a burning period of from two to two and a half hours for the one gallon size and approximately four to five hours for the two gallon size. The larger stack heaters burn for a considerably longer period. The fuel now being used is for the most part stove distillate, although a number of growers are still using crude oil.

It Comes on Clear Nights
In the region around San Francisco Bay and extending southward to San Benito County frost during the blossoming season usually occurs on clear quiet nights or when there is almost imperceptible draft from the north or southeast. The critical temperature is ordinarily not reached until 1:30 or 2 o'clock, which necessitates burning the heaters four or five hours. The ordinary frost coming in March or April does not generally fall below 27 or 28 degrees Fahrenheit. As it is possible to raise the temperature three or four degrees by opening heaters it is entirely feasible to fight a frost of this severity, but if the temperature goes lower it is questionable whether the crop could be saved by the type of equipment now in general use.

In addition to the heaters the equipment really essential is a tank wagon for filling the oil pots, a storage tank for reserve supply of oil, a set of test thermometers and an electrical alarm. The thermometers and alarm are especially important as their use depends the amount of fuel burned and the safety of the crop. Test thermometers may result in the loss of the crop in addition to the oil used for nothing.

Final Vigilance Necessary
Success in fighting frost in orchards at frosty locations comes only with vigilance. Not one frosty night in the

critical season can go unheeded nor should the pots be lighted needlessly. Close observation of climatic conditions is valuable in determining what temperatures may be expected. The grower should know from his thermometer the temperatures in his own orchard and just what he can do with his heaters in an emergency. Apricots usually blossom profusely and unless attacked by disease set heavily. A proportion of these could be lost by frost and still have a satisfactory crop. A close watch of the temperature will show the close observer at what point he will lose a small portion and at what point the heaters

should be started to prevent complete loss. Orchard heating is too expensive an operation to be carried on in a haphazard fashion, although to the careful man whose orchard is subject to this trouble it gives excellent returns on the money and time invested.

HARDY AVOCADOS

Since the recent cold snap there has been much interest shown in avocados that passed unscathed through that trying period. Among others being observed by the committee on varieties is the Ward. It passed through the winter when nearby Fuertes were injured. The fruit is a semi-thick skin, dark purple in color, somewhat rough and pebbly. It was top worked

on one seedling with three standard varieties and was the first to bear. The seed is comparatively small; the oil content 24.98 per cent; ripens December-February.

KERN COUNTY TREES AND VINES.

In the report on tree statistics for 1921 by Horticultural Commissioner Pomeroy we note the following of unusual interest:

There are 43 acres of pomegranates, a comparatively new crop of considerable promise. Of citrus trees the acreage is 1,332, nearly all of oranges. Wine, table and raisin grapes combined total 10,000 acres. The least planted of orchard deciduous trees appeared to be quinces and nectarines and the heaviest plantings are of apples and pears.

A Gas Well On Your Farm!

For Lighting

For Cooking

For Ironing

For Water Heating

THAT'S precisely what you can have—with a Colt Lighting-and-Cooking Plant! Artificial gas that produces the most marvelous light known to science—a light many times brighter than that given by gas as used by city-folk; a light so near to sunlight it has coaxed hens into laying and vegetables into sprouting. . . .

Gas that makes the hottest of cooking flames—boils coffee in four minutes by the watch. So clean you can draw a silk handkerchief across the bottom of a pan and not soil it. No odor while burning. No matches necessary to ignite it.

Gas for lighting home, barn, driveway and outbuildings.

Gas for cooking.

Gas for ironing.

Gas for water-heating.

THIS gas is Carbide gas, and the simple Colt machine makes it for you automatically—when you need it, and only when you need it. Starts and shuts off supply automatically.

Colt Plant Simplicity Itself

The Colt generates this wonderful gas by mixing carbide with plain, ordinary water. It does all the work itself—there is nothing to get out of order. No expensive unit requiring replace-

ment in short period of time. The gas is yours at the twist of fingers. And carbide is readily obtainable from warehouses at all convenient points. There is no waste. Even the residue makes excellent fertilizer and whitewash. Easily installed, and the cost is astonishingly reasonable.

More Than 341,000 Have Own Gas Well

Carbide lighting and cooking is not a new-fangled, untried idea, the dream of a visionary. You will find it on more than 341,000 farms and country estates. Owners are enthusiastic about it. It makes their home stand out in the community. It makes it more valuable, more cheerful and more comfortable. It drives out the sweltering coal range—the dangerous, messy oil lamp that imperils eyesight and home. Chases drudgery. Brings sunlight wherever wanted.

Get Full Facts—Mail Coupon

You will want a Colt "Gas Well" once you are told the full story of the joy, comfort and convenience it brings—the utter simplicity and do-the-work-itself operation of the machine. Mail the coupon below. It will bring you a wonderful and amazing story. Send it today—NOW.

KIRKMAN NURSERIES

This Orchard Yields an Average Income of Six Hundred Dollars per Acre

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

OUR EXPERIENCE

has been gained through thirty-two years of progression in the nursery and orchard business in California.

WE OFFER OUR SERVICES

in undertaking the planting and care of commercial orchards for prospective owners desiring a profitable orchard or vineyard without undertaking the improvement work. We will furnish the land and bring it into bearing under the guarantee that it will be PROFITABLE, or ALL MONEY invested will be returned to the customer with interest. The payments made by customers constitute a first lien on each subdivision tract. If every property becomes highly profitable as we plan all customers will take heed. If for any reason some of them should prove to be only fairly remunerative the customer has not taken a greater hazard than to make a safe real estate loan.

We have been growing orchards for others in conjunction with our nursery business for several years. ALL of these have been profitable to our customers. We are now in a position to serve those interested in high class income properties to the best advantage. Lands already secured for this purpose are situated at strategic locations on or very near paved highways and the very best of soils that can be secured regardless of cost. We now have growing or in the course of improvement a total of sixteen hundred acres, including considerable plantings of Thompson Seedless, Malaga, Emperor and Muscat Vines, also canning and drying peaches, apricots, plums, prunes and figs, including one of the finest young Kadota orchards in the state. These plantings are in Kern, Tulare, Madera, Contra Costa and Merced Counties, adjacent to thriving towns, modern schools, etc. We are willing to put our money in with our customer's and safeguard him against any possibility of a loss. Our part of the investment and our profit comes out of the crops of the properties. Details and location of properties on application.

TREES AND VINES

for everybody. Send for our descriptive price catalog.

The Avocado---America's Most Wonderful Food

THE last issue of Pacific Coast Record, Los Angeles, of which H. W. Heyl is business manager, has an excellent article on the avocado written by the editor, J. D. Minster. A feature of the article is a number of recipes for serving avocados in every course of the meal, from the cocktail to the ice cream. Mr. Heyl writes that he will be glad to send copy of this paper to any avocado grower who will send him name and address. From notes on the history of the avocado as given in the article we quote:

A fruit which is coming into general use in restaurants and hotels in California, and for that matter throughout the United States, and one which promises to be a general food throughout the country within the next ten years, is the avocado. North American horticulturists point to this as one of the greatest undeveloped sources of food at the present day.

In Mexico and Central America, as well as through Hawaii and the West Indies, the avocado is fairly well known, and in the former country it is a staple article of diet with the Indians who consider it a gift of the gods. That it will soon be as well known as the banana and much more widely used, few horticulturists dispute.

Ten years ago this fruit was scarcely known. In that time, however, orchards of considerable size were planted in California, Florida, Cuba and Porto Rico, and the problems of propagation, culture and marketing are gradually being solved, so that it will not be long before even ordinary and common restaurants are serving this product in place possibly of meat.

There is no known tree food product which has the food value of the avocado. It contains a very high percentage of oil, and the flesh is of a buttery consistency when ripe, and yellow or greenish yellow in color.

The history of this tree indicates that it grew wild on the lower slopes of Orizaba in Southern Mexico and down through Central America. It spread through Central America to Peru, then into the Antilles and Brazil, and finally through all of the tropical portions of South America. The first written account as far as is known is contained in a report of Gonzalo Hernandez de Oviedo in 1526, who spoke of having seen the tree in Colombia near the Isthmus of Panama.

In 1532 Pedro de Cieza de Leon mentions the fact that this fruit was being used by Spaniards who had settled on the Isthmus of Panama, and that it was a common article of food among the natives at Arma and Cali in Colombia. Francisco Cervantes Salazar speaks of seeing the avocado in large numbers in the market places of Mexico City as early as 1554. He gave it the name of "aguacate." The Spanish name apparently was originally "ahuacate," taken from the Aztec "ahuacatel."

The first introduction into Florida was recorded in 1833 when Henry Perrine sent trees from Mexico to his ranch below Miami, at present time the center of the Florida industry. The first California introduction was in 1871 when R. B. Orr brought three trees from Mexico and planted them in Santa Barbara. Just why the California Mission Fathers, who introduced the olive, the grape and a number of other semi-tropical fruits from Mexico, did not bring the avocado is a riddle. The growing of the fruit has spread to the South Sea Islands, and Tahiti at the present time ships considerable fruit to San Francisco. Northern Australia, Italy, Spain, France, Algeria, the Canary Islands and the Philippines are also taking up the development of this fruit.

Looking at it from the standpoint of real food, experts of chemistry declare that it contains more protein and ash than any other fruit on the list. It does not contain carbohydrates as largely as any other fruit because of lack of sugar, but its fat content is above that even of the olive. The average avocado contains 20 per cent of fat while some varieties run as high as 30, and others as low as 10

per cent. The digestibility of avocado fat is equal to that of butter or beef fat. As to the calorific or energy producing volume of this fruit, a pound represents an average of calories with a maximum as high as 1,325, and a minimum as low as 1,000 calories, respectively. The nutritive value in the avocado exceeds that of an equal weight of lean beef, of ordinary white bread or any other similar food.

All Americans who have eaten avocado like it immensely. It is probable that not more than one percent of the residents of the United States today have ever tasted it, but they have done so, they admit that it is delicious. Its delicately rich flesh, its soft creamy flesh, and its satisfying effect are rarely exceeded from any other food.

Not long ago Victor Hirtler, assistant manager and maitre d'cuisine of the Hotel St. Francis, San Francisco, was asked to write an article on avocado for the table. This was done for the California Avocado Association. The following extract is produced with the permission of the association, identified by Willett L. Hardin of the California Avocado Association:

"Brillat-Savarin once said that man who invents a new dish is more use to humankind than he who discovers a new star in the heavens. As wide as is the range of dishes which appear on our bills of fare, they are derived from a comparatively limited amount of foodstuffs. Cooks and epicures have for years endeavored to devise new dishes to tickle the palate of those blessed with eating goods; yet these new dishes result themselves into new combinations and mixtures of known food stuffs, become popular only through their flavors or savory combination, or as an ephemeral success and vanish through the fad of the hour or through the predilection of a celebrity of the day."

"But given a new food product, either of the gardens, fields, or woods or the streams or oceans, a new material is given the expert cook to his ingenuity in bringing out the characteristic individuality in its original form. The remotest product in the temperate zone have been sacked to produce something new, may become of use as human food, and the supply is so varied as to permit a large assortment where to pick according to season. Preparation has further extended the amount to choose from during the whole year, and the development of transportation gives today to the range man a variety on his bill of which a hundred years ago not a prince could afford."

"Today it is the explorer in foreign countries who meets with new dishes and having acquired a liking, introduces them at home. The world traveler in his peregrinations meets new creations of the chef's art, wishes to find them on his home table. Governments in their search for new foods for their increasing populations send out scientists in quest of a material likely to prove of value as a new foodstuff."

"It is such new products in the hands of an expert chef that enables him to produce those new dishes which make him famous and incidentally bring a welcome addition to the table. Among these new introductions which have been found of value and which a ready market is found for is the avocado. The avocado is served in its raw state, and the is indeed adapted to a variety of preparations to which most fruits do not so readily lend themselves. The characteristics of a good avocado are: Thin skin, small stone or pit, flesh of the consistency of butter, smooth and free from fiber. Maturity can be determined by pressing with the thumb on the skin, when the flesh should give way; also when halved, the skin or covering of the stone should adhere to the stone. Shape has nothing to do with flavor or quality. It is claimed that small, thin fleshed varieties of Guatemalan avocados are a finer, more delicate nutty than the large, thick fleshed varieties. There is not a course with which the avocado cannot be served, either in the raw or the cooked state."

cocktail to ice-cream. If we consider the raw state first, we can serve this fruit chilled on ice, halved, and served with a French dressing. The simplest way of serving it is to halve it lengthwise and remove the stone, making incisions in the flesh pretty near to the skin. Sprinkle salt and onion or lime juice over it and chill it on ice. Again, the flesh can be scooped out, lightly mixed with mayonnaise, and refilled in the shells. It also blends well with other salad ingredients, such as celery, apples, tomatoes, walnuts, pineapple, grapefruits, red pepper, etc. The dressings may vary from plain salt and lemon juice to French dressing, mayonnaise, and Thousand Island dressing; also it is sometimes served with sugar and cream.

"As a cocktail, the flesh is cut in cubes, mixed with cocktail sauce, and green peppers, chilled, and served in glasses. As a sandwich, the flesh is rubbed through a sieve, seasoned, mixed with mayonnaise, spread on lettuce leaves, and pressed between two slices of bread. In Mexico, the avocado is used as an ingredient of soups, to which it is added cut up in small pieces. Fish baked with avocado is a novelty worth trying. Most fishes when baked in a dry state, without the addition of a generous amount of fat, be it either butter or oil, dry out quickly, being in general deficient in fat. The addition of avocado, rubbed to a paste with either butter or olive oil and seasoned with paprika and salt, then spread on the fish and baked in the oven, is a decided novelty. As a garnish with a planked fish, the combination is also pleasing."

THE PROBLEM OF OLD ORCHARD DECLINE

By Leonard Coates

This subject has been handled in a very able manner by one of California's best known and successful deciduous orchardists, but I doubt if stress enough was laid upon the injury done to most orchard trees with the pruning shears and saw. This wounding, mutilating, usually begins when the tree is planted and continues in different forms according to the whim of the operator. It is simply a phase of commercial orcharding; it would not pay to do otherwise. To hire men who would literally make only clean cuts and cover the same with a protective compound could not be done, because the men do not exist in sufficient numbers who would and could do it. The late Elbert Hubbard wrote a book on the man, under McKinley's administration, who carried a letter to Garcia, and admitted that the whole world was crying out for just such men, and it is still crying out.

The Vacaville fruit men made a lot of money by their shrewdness in grafting over their orchards to any and all promising new early fruits. Vaca Valley was ever foremost in the development and marketing of the best early fruits, but the orchards could not stand the strain and soon succumbed. Their lease of life would have been renewed with plenty of water during the dry years, but the result was inevitable.

"Mutilation," I take it, is the prime factor in orchard decline, and, as land becomes scarcer and more expensive, the policy of the commercial orchardist of the past and of the present will become less profitable.

I would urgently advise all growers to study Dr. Whittens' article, "Response of Deciduous Fruit Trees to Pruning," in the September Monthly Bulletin of the State Department of Agriculture.

THE NICKEL SUN-MAIDS

Twelve months ago a nickel package of raisins to be sold and bought as a confection was unheard of. Today, due to intensive merchandising and advertising, California raisins in nickel packages are being sold all over the country, in crossroads villages as well as the big cities, and by confectioners, tobacconists, bootblack stands, street vendors, and through dozens of other new outlets to millions of people who had previously thought of raisins only as an auxiliary in cooking or for table desserts. Four hundred million five cent packages will be sold this year to this new market, thereby removing from the ordinary channels of distribution and

consumption the burden of absorbing 20,000,000 pounds of raisins. Incidentally, the demand thus created by advertising has resulted in the carton factories of the West running at full production—and the orders came at a time when much of the equipment was idle. Once again is seen the stabilizing effect of good advertising. —V. R. Churchill, vice president Honig-Cooper Co.

WILLOW CULTURE

In years ago some attempts have been made to grow willows or osiers for commercial purposes. More than a quarter of a century ago, the late E. K. Sweetser of Santa Monica, then superintendent of the large Rindge or Malibu ranch in Los Angeles and Ventura Counties, planted all sorts of "basket willows" obtainable. Of the one known as "golden osier" he made an especially large planting.

These willows were to be planted in favorable locations, in wet lands, and left to chance to develop commercial cuttings. But in many countries willows are set out in commercial plantings, in rows, cultivated and fertilized. They are planted on good, though low lying lands, neither sand nor clay, but a peaty loam, subject perhaps to occasional overflow. The crop has been found profitable for furniture, baskets, etc. There is always some market for such material in any country. In the United States the labor problem proves the most serious deterrent to the more extensive use of basket willows.

Where cultivated the cuttings are put out in very early spring, ranging in diameter from that of a lead pencil up and in length from 12 to 18 inches. They are planted from 18 to 24 inches apart, each way, to allow for cultivation and are, in some countries, heavily fertilized, for the willow is a gross feeder and will stand the strongest fertilizers in heavy applications. The crop is cut as soon as the leaves fall, tied in bundles and stood with the butts in water until spring; the sap then moves and the bark easily peels. This gives white rods which are sorted for length and again tied in bundles. The unpeeled rods are not stood in water but are seasoned as soon as cut. Varying shades of "wood color" are obtained by boiling the rods in water as soon as cut and then peeling off the bark. The cost of handling may possibly preclude willow culture from the list of California's commercial industries. As the material is very heavy when first cut it should be handled "on the ground" until ready for market; hauling away would add materially to the cost.

PLANTING DISTANCE OF FRUIT TREES

F. W. Allen, assistant professor of pomology, University of California, has recently made a report on the planting distance of fruit trees based on a study of the yields of trees planted in 1915 at the university farm school at Davis.

The report shows that with rapidly growing trees such as Elberta peaches and Pond plums the shorter distances of planting have already begun to interfere with the yields. With the smaller growing varieties, such as French prunes and Bartlett pears, the closest plantings have produced the largest yields thus far.

DAIRY PROFITS—AND GOODYEAR BELTS

"Goodyear Klingtite Belts have increased the operating efficiency of my farm at least 50%. In a single day, I milk 40 cows and separate 1,000 lbs. of cream by Goodyear-belted machinery. My Goodyear Klingtite belting works perfectly in winter and summer. The Goodyear Dealer gives me belting service regularly."—ARNOLD FERN, Farmer, Baldwin, Wis.

On the lighter farm drives used in milking, cream separating, churning, water pumping, electric light generation and household appliance operations, Goodyear Klingtite Belts give the same smoothly powerful, trouble-free service they furnish in heavier farm duty.

They are obtainable in suitable lengths for these uses, and their special construction in each case is exactly suited to the task.

They transmit full power, evenly and surely. They hold the pulleys in a slip-

less grip. They need no breaking in, require no belt dressing, and work without stiffening, stretching or shrinking, regardless of changing atmospheric conditions. Their efficiency puts an end to belt troubles on the farm.

Goodyear Klingtite Belts are sold by your local Goodyear Dealer. They come in endless type also, for threshing, silo-filling, feed-grinding, and other heavy duty. For further information about them, write to Goodyear, Akron, Ohio, or Los Angeles, California.

Funds in Bank

In case a man has money in the bank and dies, leaving wife and children and debts to pay, can the wife draw out the money from the bank? If so, how can she get it?—Subscriber.

If the deceased does not leave more than \$1,000 in any bank then the wife, on filing an affidavit with the bank, stating that the depositor is dead and the affiant is the surviving wife, and the whole amount left on deposit in any and all banks in this state does not exceed \$1,000, may procure such deposit, and a receipt of the affiant is a sufficient acquittance to the bank. This may be done without applying for letters of administration on the estate. Of course if there is other property of the decedent there is no particular reason for taking this means of procuring the money as in such instance the wife would have the first right to be appointed administratrix of the estate, and on production of certified copies of the letters of administration she would be entitled to receive the money as such administratrix. Debts of the deceased of course must await the regular course of the courts in probate and the family is also entitled to have an order made for its support out of the estate, which takes precedence even over debts of the estate.

Joint Homestead

Husband and wife have accumulated property and have minor children. It is the desire to arrange property so that it will go to the survivor with the least expense and so that in case the husband dies the wife cannot be persuaded by the children to sell or invest the property. What would be the best means of handling this matter?—Subscriber.

A joint homestead could be declared on the property, in which event, on the death of either of the parties the property would vest in the survivor without the necessity of taking administration upon the estate in so far as the home is concerned. If a will is made, as the property is common property, the husband would be entitled to convey by will only an undivided one-half in the property. An arrangement could be made whereby a life estate in the property could be established with the remainder to the children, but that of course could be distributed by the joint consent of all parties, and in this case it would be a rather complicated procedure, so that the homestead and a will taking care of all the property other than the homestead would undoubtedly be the best means.

Wife Sole Legatee

Under will wife was made sole legatee during her lifetime. No provision was made for the sale of the property. If it becomes burdensome could she dispose of the property, assuming that there are minor children?—Subscriber, Hughson.

The code provides that whenever it is for the advantage of the estate the executor may sell real estate or may be required to do so on application to the court of any person interested. If property has been distributed to the widow, then it will be necessary to have a guardian appointed for the children and similar proceeding taken to terminate the interest which the minors have in the reversion of the property.

Responsible for Children's Bills

Is a father obliged to pay bills contracted by his daughter eighteen years of age? When does a son become responsible for his own bills?—Subscriber.

A parent is liable only for articles necessary for the support and maintenance of a minor child under his charge, according to his circumstances. Upon the attainment of majority the authority of the parent over the child ceases and the parent then ceases to become responsible even for necessities. The son becomes of age at 21, daughter at 18.

Directors Interested in Contracts

Have the directors of an irrigation district the right to be interested in ditch diggers or furnish teams or implements for contracts on works of the district or be interested with other parties in making contracts to do work for the district? Who are the proper parties to investigate such action if they are wrong?—Subscriber, Ter Bella.

Section 58 of the irrigation act provides that no director or officer shall in any manner be interested in a contract awarded by the board or profits derived therefrom, and for a violation of this provision such officer shall be deemed guilty of a misdemeanor and when convicted thereof shall forfeit his office and be punished by a fine not exceeding \$500 or be imprisoned not exceeding six months, or be subject to both fine and imprisonment. The procedure to take against directors violating this provision would be for any party in the irrigation district to make complaint to the district attorney of the county. The irrigation act also provides for the recall of the holder of any elective office in the district, which includes the directors. The provisions for recall are quite elaborate but are instituted by the signing of a petition by registered voters, equal to at least 25 per cent of the highest vote cast for candidates at the last general election in the district.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dahlia Divisions

In digging dahlias for winter storage I found numerous small bulbs attached to the large ones. Can the small ones be detached and planted or are they to be left on the large ones?—Subscriber, San Fernando.

It is better to divide these clumps and, like potatoes, each tuber will form a new clump during the coming summer's growth, but bear in mind that unlike the potato tuber the "eyes" of the dahlia are not generally scat-

tered over the bulb but are on around the stem or woody connecting with attaches the young tuber to the mother plant. Hence to secure new plant care must be taken to separate with the tuber a portion of the stem. These may be planted three to six inches under the surface in good rich soil.

Salt peter in Stumps

I've read in your question and answer columns about using salt peter stumps and burning them out. I like to know something definite. Say for instance, take a two foot stump; how much salt peter would be needed; how long will it take to per-

trate and how soon can it be torn open with dynamite, and how soon can it be burned?—Subscriber, Orland.

Removal of stumps by saltpeter is more or less slow of operation as suggested by the inquirer. The quickest method of handling it is by the use of a small charge of dynamite. Break up the stump, after which allow a few weeks of drying out which will make its final disposal by fire comparatively easy. However, if the saltpeter is used, bore three or four large auger holes as deeply as can be handled. Fill with saltpeter. Action is hastened if holes are filled with water so as to dissolve the saltpeter.

Henry System of Pruning

Would like to see an article discussing the Henry system of pruning by someone who has made a study of it and is not prejudiced against it.—Subscriber, Wasco.

We are passing this question on to our subscribers. It is new to us as we have not heard of the Henry system.

Mexican Morning Glory

P. D. B. wishes to know if anyone has a plant or plants of quamoclit grandiflora, a Mexican vine with fiery red flowers an inch in diameter, borne in succession on long peduncles. The plant has three lobed leaves, and a full description was given about August, 1914, in the Pacific Garden under the name Ipomeae Howardii.

Water Measurement

I have a lease on the Colorado River Indian reservation. The contract says that the government is to furnish four acre-feet of water for the year. It does not measure the water but charges for nine inches each irrigation. How large a stream of water would be required to cover seven acres nine inches deep in three hours? Can it legally charge for excess water where no measurements are made?—Subscriber, Parker, Arizona.

It is not possible to answer correctly when size and kind of ditch, speed of flow and depth of water are not given, but an approximate measurement of the water used can be made by constructing a gate across a dirt ditch so there will be comparatively still water above the gate and a clear drop having air behind the overflowing water. Place a stake upstream about three feet from the gate with the top of the stake level with the bottom of the gate opening, then with a slide moving from one side of the gate close the opening until there is five inches of standing water on top of the stake. Measure the width of the opening left in the gate and multiply by five for the miners inches. That is, if the water stands five inches on the top of the stake and the opening is 20 inches wide there will be about 100 miners inches of water passing through the gate. This will cover one acre two inches deep in one hour and take four and one-half hours to cover one acre nine inches deep, or 31½ hours to cover seven acres nine inches deep. If the seven acres is flooded in three hours it is very likely better results can be obtained by using a smaller stream a longer time and not using so much water at one irrigation. A depth of four to six inches should be enough and more is likely to leach the fertility out of the soil. We do not see how a charge for excess water can be made when there are no measurements.—J. B. N.

Testing Milk

Where can I have a free test made of milk to determine whether it is real milk? We have tried making butter out of the cream but it will not turn.—Subscriber, Burbank.

By taking a small quantity of this milk to the health department of the city of Los Angeles think you can have a milk test as to butterfat. Presume the cream is not "ripened" sufficiently or it may be it has not been at right temperature when churning has been attempted. Cream should be allowed to ripen at from 45 to 50 degrees Fahrenheit until it is properly "soured" or until the lactic acid has been developed. Then the temperature at churning time should be not lower than 55 degrees Fahrenheit, though often when cows are on dry feed it is necessary to raise the temperature to from 60 to 65 degrees Fahrenheit. Likewise if it is desired to hasten the ripening process a temperature higher than the 50 degrees mentioned may be advisable. If temperature is too low one may raise it by following the old time method of "driving the devil out of the cream" by dropping a hot

horseshoe into it; or the more modern and more cleanly method often recommended by Mrs. Sherman in these columns, stirring the cream with a bottle filled with hot water.

Gophers and Figs

Will pocket gophers allow success in planting figs in alfalfa?—Subscriber, Denair.

The only way to have fullest success with figs in alfalfa is to keep the gophers down. If the land is well leveled deep flooding at irrigation time aids, but the trap, poison and smoke treatments are surer. Then there are some cats which earn their living many times over by gopher catching. Gophers are apparently very fond of fig roots, and must be kept under reasonable control.

Sweet Butter

Is it true that butter made out of

sweet cream will not keep long? I find it very difficult to make the cream turn sour. If I let it stand four or five days in a warm place it will sour, but not before it has developed a strong odor. The only way I can make edible butter is to churn every other day while the cream is fresh and sweet and that butter begins to spoil after a day or two. Now the trouble is not lack of cleanliness because I am very particular about sterilizing my dishes, neither does the fault lie in the fact that I leave a lot of buttermilk in the butter because I am careful to work it over a second time and, as far as possible, get the milk all out of it. Can you suggest anything that might help me out of the difficulty?—Subscriber, Santa Cruz.

Sweet butter, that is, butter made from only slightly ripened cream and left entirely unsalted is usually considered our highest quality butter. Some housewives make a specialty of making into little "pats" of, say, one-

Cletrac Is At Home Among The Trees

CLETRAC is low-set and smooth-bodied. It slips in and out among the trees with short quick turns—comes about at the end of the row in less space than a team requires. Standing only 13 hands high—with no projecting lugs to catch low-hanging branches or scrape and bruise the bark—Cletrac is the ideal "orchard tractor."

With a Cletrac to turn under your cover crop, you can work right up close to the trees. This tractor leaves no patches of unplowed ground that so often make orchard plowing a half-power, half-horse job.

After plowing, Cletrac follows through with discing, fertilizing and lime-crushing. Its broad tank-type treads carry it lightly over soft ground without slipping and packing—it gets through with your heavy spraying no matter how wet the soil.

Today Cletrac is the admitted leader in orchard work. More fruit growers every year are using it exclusively. Remember—there's no obligation connected with learning *all* about Cletrac's *proved* ability. We'll demonstrate at your convenience.

HARD THIS WAY BUT—

half pound and selling to regular trade with very frequent deliveries. It is very difficult, however, to get perfectly sweet cream to deliver up its butter globules. If the cream is started at the right temperature, say 50 degrees Fahrenheit, it will usually "sour" very satisfactorily. If the weather is cold and the temperature too low it may be warmed by filling bottles with hot water and setting them down into the cream. Then raise temperature at churning to at least 55, preferably 60 or 62 degrees. Churn, wash, work, put into pats and sell at once. It should command from five to ten cents above salted butter. Of course it will keep under ordinary conditions only a very few days. If, however, the salted butter is preferred the inquirer should get satisfactory results by close observation of temperatures, thorough cleanliness and salting at the rate of 2 1/2 per cent of total butter.

Nematodes in Alfalfa

Will alfalfa bring nematodes?—Subscriber, Denair.

No, but if the soil is infested alfalfa roots suffer. In fact alfalfa is one of the crops most seriously affected by the nematodes.

Green Manure Crop

I want to seed alfalfa to enrich the soil. Will sweet clover be better?—Subscriber, Denair.

Greater tonnage may be had from the sweet clover for the first few months, but if time is allowed we presume there would be little difference in results.

Eucalyptus Mulch

Are eucalyptus leaves good to use as a fertilizer in the garden and among the flowers?—Subscriber, Corona.

They would be fine for a mulch, or if thrown into a compost pile with ashes, poultry manure, soil, garbage from the table and numberless other wastes of every home they would be more effective as a real fertilizer. However, it takes a year or more to make a good compost out of dried leaves, weeds and waste. It is worth the time, however, and a year may be sufficient if worked over and moistened through the summer.

Curdling Sweet Milk

Would you kindly inform me through your paper of name of the flower or plant that is used to curdle sweet milk and where it can be obtained?—Subscriber, Novato.

To curdle milk in the manufacturing of cheese the factories simply use rennet, which may be secured from the lining membrane of an unweaned veal calf. It may be secured in the form of an extract, however, from any store handling dairy supplies. To more directly answer the question, the plant presumably is Galium verum or Yellow Bedstraw or sometimes called Lady's Bedstraw. The plant is a fine ornamental for rockeries and along banks. It is a weed over much of the eastern part of the United States. We do not think it is handled by nurserymen on the coast.

Lime-Sulphur for Curl Leaf

Is there any way to mix lime and sulphur to be used as a spray for curl leaf of peach trees, besides buying it already mixed? Would lime and bluestone answer the same purpose for curl leaf?—Subscriber, Visalia.

The mixture of lime and bluestone, if properly made, is one of the very best fungicides for preventing curl leaf. In fact, that mixture will result in Bordeaux spray, full instruction for mak-

ing of which was given in the pest fighting special of the Cultivator, September 24, 1921. The formula is too long to give in this column, but in a word it consists of copper sulphate (bluestone), five pounds; stone lime, five pounds; water, 50 gallons. Dissolve the sulphate in water and slake the stone lime. Pour together in the remainder of the water, thoroughly stirring. The same issue gives the formula for home making of lime-sulphur spray, but unless one understands the mixing purchase of the commercial mixture is better and in any case probably cheaper.

Beet Pulp for Calves

Can you advise me as to young stock fed on beet pulp and then turned out on range? I have been told that beet pulp affects the stomach and they won't live if turned out on range.—Subscriber, Santa Maria.

It is possible care should be exercised to avoid overfeeding, especially of young stock. Henry's "Feeds and Feeding" says: "Breeders of pure bred dairy stock recommend dried beet pulp for cows on official test which are receiving heavy concentrate allowance, as it has a tendency to keep the bowels open and is not apt to cause digestive disturbances." Woll says: "As it is produced in large quantities and fed at the factories it is often fed too heavily for best results, sometimes without dry roughage or grain feed. Not more than 100 pounds (of wet pulp) per 1,000 pounds of body weight should be given daily." We may add that it takes about ten tons of wet pulp to produce one ton of dried pulp. As it is not particularly high in feeding value it is probable care should be exercised not to feed too heavily to very young stock.

Grafting Peaches

I have seedling peach trees, one and two years old, that I want to graft into peaches. One man told me that grafting peach on peach is unsuccessful. Is he right? If he is right, can I bud?—Subscriber, Fair Oaks.

The grafting of peach on peach stock may be readily done but might be hard for the novice without complete instructions.

Bats in the Garret

There is a colony of bats in the garret and they are so numerous that they have ruined the ceiling. How may we get rid of them?—Subscriber, Pomona.

Bats are insectivorous, in fact, they feed exclusively on insects, so they are generally considered beneficial. There seems to be no established procedure in destroying them. So far as we can find any literature upon them it has to do with their protection. They certainly could not be poisoned for with their feed coming from flying insects they will not touch any poisoned bait. Our impression is that the best procedure would be to stop all openings in the garret. If this were done in the night when they were outside of the building and they could not gain entrance the question would be solved. If, however, some were left in the building and could not be controlled in any other way poison gas, the same as used in fumigating citrus trees, would rid the place of them. This hydrocyanic acid gas should be handled, however, by an expert who knows its deadly qualities.

Sow Bugs

Our strawberry patch is badly infested with bugs of the variety that I have always known by the name of "sow bugs." That may not be the technical name but perhaps you may know what I mean. They are the kind you find on the under side of

a board that has been lying on the ground. I am afraid that when berry time comes they will take all the fruit. Can you tell me of anything that may safely be used to kill them?—Subscriber, Santa Cruz.

Sow bugs may be a most serious pest in a wet season like the present, especially in strawberries where even in warmer weather they are protected by the leaves of the plants. Where the infestation covers only a small area hand picking is a sure way of reducing. They may be poisoned by using slices of raw potatoes, carrots or other vegetables rolled in paris green. These pieces may be placed under the vines or wherever the pests gather.

Ginseng

Will you kindly give me some information about how to raise ginseng? Is it very profitable to grow and is the seed very expensive? How many years after planting before one can dig any roots? Is there always a good market for ginseng and what does it sell for? Is it hard to grow? Don't you think parts of Oregon or Washington are better suited for it than California?—Subscriber, Los Angeles.

The best advice we can give is one word: Don't. The effort to grow ginseng in California has not resulted in profit and we fear has caused serious loss to many who have tried it. It requires a lath house or other protection from sun heat and much labor. The market is in China. Americans can find no medicinal value whatever in the root and its value to the Chinaman as indicated by the price paid seems to be because of grotesque and peculiar forms of growth. The Chinaman looks upon it as a universal panacea. The plant aroused sufficient interest, however, so that at one time the United States department of agriculture issued Farmers' Bulletin 551, "Cultivation of American Ginseng"; also Farmers' Bulletin 1184, "Ginseng Culture." These may be had free by writing the Department of Agriculture, Washington, D. C., if they are still in print. The bureau of plant industry, United States department of agriculture, Washington, D. C., also issued in 1912 Bulletin 250, "Diseases of Ginseng and Their Control." If still in print this bulletin may be had by writing Superintendent of Documents, Washington, D. C. Its price is 15 cents. The Northwest would doubtless be better adapted to its culture for it is a native of the damp woods along streams in the Middle West.

Root Knot

I send rotted pieces of stumps. How can I get rid of them? Some are as large as one's fist.—Subscriber, Clovis.

This is root knot and there is no satisfactory treatment. In planting vines be sure that roots are free from the knot and observe especially around the crown of the tree as to whether the disease is manifesting itself there. Reject all trees or vines which show it. Where trees are planted, especially if they are in bearing or are still producing fairly well, we would not disturb them, for they may have several years of usefulness. If, however, it is manifested as crown gall cut off smoothly with sharp chisel and paint over the healthy wood with Bordeaux paste.

Guavas in California

Are guavas cultivated in California? If so, where may trees or bushes be obtained?—Subscriber, Hayward.

There are many thousands of guava trees in California and if planted in a frostless section they bear well and usually prove profitable. The guava, however, is pretty close to the tropical in its requirements and will stand but little of cold weather.

Timber Along Highway

To whom do road trees belong—the man who owns the land through which a public road runs or the county? How wide a strip (if any) is exempt from ownership? If so, from what point is the measurement made (center of track?) Frequent hard rains make it necessary for wood to be moved over on to higher or firmer ground. Owner has never objected to this but would like to cut and use wood.—Subscriber, Bonsall.

As a rule roadways in farming sections are used by the public because of an easement or dedication for public use by the owners of the abutting acreage. Hence the acreage of most farms is computed to the center of the highway. The practice is for the land owners to plant a shade row nine inches out from the line. In case the land owner tires of the shade or wishes to use the growing tree for timber or fuel purposes he cuts and uses without let or hindrance. In some cities and counties, however, one must consult the city or county forester.

Gumming of Cherry

How shall I treat cherry trees which have gum forming over body and branch? Is there a special kind of knife or tool to clean infected parts? I used Bordeaux paste last year without results.—Subscriber, Beaumont.

It is quite probable this is not a fungous trouble and if it is not the Bordeaux would have no particular value. It is more probable that the cause of the trouble is the physical condition of the tree or soil. Extreme drouth at one season followed by saturation of the ground later may cause a deciduous tree to refuse to function properly, and sour sap, gumming, little leaf or other indications of trouble are all we have to judge from as to specific conditions. A thorough study of tree and soil conditions only can determine. Where a cherry tree is seriously gummed on trunk and branch we would hardly consider it worth the effort to restore it to health.

Squash Bug

I found this bug on my almond trees. Is there any means of getting rid of it, and what sort of a bug is it?—Subscriber, Manteca.

The insect accompanying this query was badly mashed in the mail. There were sufficient of the remains, however, that we are reasonably sure it is the common squash bug so destructive in gardens. We have never heard of it being a serious pest of the almond orchard. When trees are in leaf, if present in sufficient numbers, it could be controlled by a spray of arsenate of lead.

Insulation for Cold Storage

Would ask as to lining of a cold storage plant. What is generally used for the lining? Is cork used and where is it grown?—Subscriber.

For insulating purposes cork is probably one of the very best, though in California redwood sawdust and the finer or planer shavings are practically as satisfactory. Cork is secured from the bark of the cork oak, *Quercus suber*, which grows in Southern Europe and Northern Africa. There are many beautiful cork trees in California where they do exceptionally well, making one of our most beautiful roadside trees. We believe some of the oldest trees of this variety in the state are at Niles, Alameda County. We think the cork chips may be had of any dealer in refrigeration supplies.

Prunes Leak Sap

I have a few two and three year old prune trees that the sap is leaking out of and trees do not seem to make any

headway. Can you give the reason for this and how it may be overcome?—Subscriber.

It is pretty firmly established that such effect is due to drouthy conditions last fall about September and October—a physical drouth. The same condition occurs where the trees are planted on soils of too great alkalinity—a physiological drouth. The latter is a condition where plenty of water occurs, but the plant cannot use it. Good care, including ample water supply, is all that can be done to recall trees to former vigor.

Thrips on Pomegranates

Could you tell me what spray to use for thrips on pomegranate trees, also when and how often, what strength?—Subscriber, Porterville.

Just as the buds begin to open make thorough application of five per cent nicotine dust, or, perhaps better, one

of the commercial ready-to-use nicotine dusts. These are usually prepared containing small percentage of pure nicotine and perhaps 75 per cent of sulphur. Of course the dust application should be made as soon as buds begin to open and at intervals for a few weeks.

NEW HEAD AT DAVIS

The University of California announces that Claude Burton Hutchison, professor of plant breeding of Cornell University, has been selected to head the college of agriculture at Davis and to become professor of plant breeding. While with the Missouri agricultural experiment station, Professor Hutchison gave special attention to soil and drainage investigations in relation to crop production. He was author and co-author of many bulletins of the Missouri station. At Cornell University his main field of investigation was that of plant breeding. He has achieved distinction as an investigator and writer in this field.

Why Use Poisonous Sprays and Chemicals

Why Risk Having Your Crops Condemned?

Los Angeles chemists have produced a spray which is absolutely NON-POISONOUS and even more effective than the poisonous sprays and chemicals used in the past, because it throws off fumes which kill as well as by direct contact of the liquid. It is aptly named FUMISPRAY for this reason.

FUMISPRAY kills by contact and fumes caterpillars, cutworms, thrips, aphids and moths. Citrus and deciduous growers find it frees their orchards from all kinds of scales and pests. It is the truck farmers' salvation.

FUMISPRAY is the last word in insecticides. It is a hydro-carbon oil emulsion and, we repeat, NON-POISONOUS. It will not injure the most tender growths. It is easily prepared and used and very economical. FUMISPRAY is tried, tested and proven. You will no longer fear condemnation of your crops if you use FUMISPRAY. Write for prices and send us the name of your dealer. Special proposition to commercial sprayers. We guarantee satisfaction. Herbicide Chemical Laboratories, 1963-H Santee St., Los Angeles, Cal.

The Cultivator costs only one dollar yearly

Household Department

"BURY ME NOT ON THE LONE PRAIRIE"

WEEKS ago request came to the household department of the Cultivator for the words of the old cowboy song, "Bury Me Out on the Lone Prairie." One of the largest libraries on the Coast was set to hunting through its files and indexes but was unable to find it. Then we appealed to our "court of last resort," the readers of the Cultivator, and almost by the next mail letters began coming in with clippings from old scrapbooks, with manuscript jotting down recollections of the old song.

C. A. Wheeler of Paso Robles sent in clipping with comment by Prof. W. L. Wright:

"If the average person were asked to name an American folksong he would probably mention some one of Stephen Foster's well known melodies. These, however, are not folksongs, but are the creations of a pioneer American composer.

"Our Western cowboys have produced one of the few unalloyed American folksongs. This is 'The Lone Prairie,' also known as 'The Cowboy's Lament.' The song is as follows:

"O bury me out on the lone prairie,
Where the wild coyotes will howl o'er me,
In a narrow grave just six by three;
O, bury me out on the lone prairie.

"So they buried him there on the lone prairie,
Where the coyotes howl and the wind goes free,
In his narrow grave just six by three;
So they buried him there on the lone prairie."

Nearly every round-up added a new verse to the song, according to Prof. Wright, and there were many variations.

This is the only version of the song we have seen with "Bury me out on the lone" prairie." The others have not. Here are the words, many more verses, as sent in by a Napa reader:

"Bury Me Not on the Lone Prairie"

Here is a poem desired by one of your subscribers. Is in a book of cowboy songs collected by Professor John A. Lomax, (Sturgis & Walton Co.) containing this and many others equally interesting.—Frances Power, Napa.

The Dying Cowboy

"O bury me not on the lone prairie,"
These words came low and mournfully
From the pallid lips of a youth who lay
On his dying bed at the close of day.

He had wailed in pain till o'er his brow
Death's shadows fast were gathering
now;
He thought of his home and his loved ones
high
As the cowboys gathered to see him die.

"O bury me not on the lone prairie
Where the wild coyotes will howl o'er me,
In a narrow grave just six by three,
O bury me not on the lone prairie.

"In fancy I listen to the well-known words
Of the free, wild winds and the song of the birds;
I think of home and the cottage in the bower
And the scenes I loved in my childhood's hour.

"It matters not, I've oft been told,
Where the body lies when the heart grows cold;
Yet grant, oh grant this wish to me,
O bury me not on the lone prairie.

"I've always wished to be laid when I died
In the little churchyard on the green hillside;
By my father's grave, there let mine be,
And bury me not on the lone prairie.

"Let my death slumber be where my mother's prayer
And a sister's tear will mingle there,
Where my friends can come and weep o'er me;
O bury me not on the lone prairie.

"O bury me not on the lone prairie
In a narrow grave just six by three,
Where the buzzard waits and the wind blows free;
Then bury me not on the lone prairie.

"O bury me not," and his voice failed there,
But we took no heed of his dying prayer;
In a narrow grave just six by three
We buried him there on the lone prairie.

Yes, we buried him there on the lone prairie
Where the owl all night hoots mournfully,
And the blizzard beats and the winds blow free
O'er his lowly grave on the lone prairie.

And the cowboys now as they roam the plain—
For they marked the spot where his bones were lain—
Fling a handful of roses o'er his grave,
With a prayer to Him who his soul will save.

"O bury me not on the lone prairie
Where the wolves can howl and growl o'er me;
Fling a handful of roses o'er my grave
With a prayer to Him who my soul will save."

Another with very different refrain comes from Mrs. J. A. Netzley of Glendora:

THE DYING COWBOY

(By Rev. T. J. Swanzy, Composed and Arranged)

"Oh, bury me not on the lone prairie,"
These words came low but manfully,
From the pallid lips of a youth who lay
On his dying couch at the close of day.

He had wasted his life till o'er his brow
Death shadows were closely gathering
now;
He thought of his home and his dear friends
nigh,
As the cowboys were gathering to see him die.

Refrain:

Where the lone dove coos and the crickets have nests,
Where the wild flowers bloom on the prairie crest;
Where the coyotes howl and the wind sports free,
The cowboy was buried on the lone prairie.

"Oh, bury me not on the lone prairie,
Where the coyotes will howl in their rage o'er me;
Oh, here in a grave just six by three,
Will you bury me not on the lone prairie!"

"It matters not, tho' the preacher once told,
Where the body is laid when the heart grows cold,
But grant, oh grant, as a boon unto me,
That you bury me not on the lone prairie.

"I oftentimes have wished that when I died,
To be laid in the graveyard on the hillside.
By the grave of my father, oh, let my grave be,
So you bury me not on the lone prairie!"

"There's another whose tears so freely she'll shed
For the boy who died on a prairie bed;
But little does it pay to think of her now,
She has curled these locks and pressed this brow.

"These locks she has curled evermore she'll miss,
This brow she has pressed will the cold grave kiss;
For the sake of those, then, who'll weep over me,
Will you bury me not on the lone prairie?"

"She has been in my dreams"—and his voice failed there—
They took no heed of his dying prayer,
So there in a grave, just six by three,
The cowboy was buried on the lone prairie.

Every set of verses which has come in shows variations from every other one and so interesting that we wish there were room to print all. The collection would be a treasure for one who studies folksongs. From every camp fire where the song was sung, from every bunkhouse where the boys gathered after supper, from the "hurricane deck of a Montana bronk" as one of our subscribers puts it, come the words that framed themselves on the lips of the singer.

We can give space to only a few more versions, but wish to credit here verses sent in by Mrs. Mary McHenry of Beaverton, Oregon; Mrs. F. J. Gehringer, San Martin; Mrs. L. L. Heseman, Corning; S. E. Maggard, Selma; Mrs. William E. York, Babbistite; Miss Agnes Peterson, Placerville.

The two following are so complete and well arranged that we give entire:

Sent by E. C. Converse, Santa Paula:

"Oh, bury me not on the lone prairie;"
Those words came slow and mournfully
From the pallid lips of a youth that lay
On his dying couch at the close of day.

He had wasted and pined 'til o'er his brow
Death's shadows fast were drawing now;
He had thought of home and the loved ones
nigh,
As the cowboys gathered to see him die.

How oft have I listened to those well-known words,
The wild wind and the sound of birds;
He had thought of home and the cottonwood boughs,
Of the scenes that he loved in his childhood hours.

"I have always wished to be laid, when I died,
In the old churchyard on the green hillside,
By the grave of my father, Oh, let my grave be;
Oh, bury me not on the lone prairie.

The Cultivator Patterns

3501. Child's Dress—Cut in five sizes: 1, 2, 3, 4 and 5 years. A two year size will require 2 3/4 yards of 27 inch material. Price 10 cents.

3888. Misses' Dress—Cut in three sizes: 16, 18 and 20 years. An 18 year size requires 4 1/2 yards of 44 inch material. The width of the skirt at the foot is 2 1/4 yards. Price 10 cents.

3876. Girls' Dress—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size requires three yards of 38 inch material. Price 10 cents.

3529. An Attractive Apron—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; and extra large, 46-48 inches bust measure. A medium size will require 3 1/2 yards of 36 inch material. Price 10 cents.

3874. Boys' Suit—Cut in four sizes: 2, 3, 4 and 5 years. A 4 year size requires 1 3/4 yards of 27 inch material. Price 10 cents.

3471. A Pretty Dress—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The width of the skirt at lower edge is two yards. A 38 inch size will require 4 1/2 yards of 44 inch material. Price 10 cents.

3873. Girls' Cape—Cut in five sizes: 6, 8, 10, 12 and 14 years. A 10 year size requires 2 1/2 yards of 54 inch material. Price 10 cents.

3882. Ladies' House Dress—Cut in seven sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 5 yards of 36 inch material. The width at the foot is about two yards. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator

Los Angeles

"I wish to be laid where a mother's
care
And a sister's tear can mingle there;
Where friends can come and weep o'er
me;
Oh, bury me not on the lone prairie.
"Oh, bury me not"—and his voice failed
there;
They paid no heed to his dying prayer;
In a narrow grave just six by three,
They laid him there on the lone prairie.
Where the dewdrops fall and the butter-
fly rests,
The wild rose blooms on the prairie's
crest,
Where the coyotes howl and the wind
sports free,
They laid him there on the lone prairie.
From G. M. Merriman, Alameda:

"O BURY ME NOT ON THE LONE
PRAIRIE"
O, bury me not on the lone prairie,
These words came low and mournfully
From the pallid lips of a youth who lay
On his dying bed at the close of day.
He had waited in pain till on his brow
Death's shadows fast were falling now;
He thought of his home and his loved
ones nigh,
As the cowboys gathered to see him die.
O bury me not on the lone prairie,
Where the wild coyotes will howl o'er
me,
In a narrow grave, just six by three
O bury me not on the lone prairie.

It matters not, I've oft been told,
Where the body lies when the heart
grows cold;
Yet grant, O grant this wish to me,
O bury me not on the lone prairie.
O then bury me not on the lone prairie,
In a narrow grave just six by three,
Where the buffalo paws o'er the prairie
sea;
O bury me not on the lone prairie.

I've always wished to be laid when I
died,
In the little churchyard on the green
hillside,
By my father's grave, there let mine be,
And bury me not on the lone prairie.

Let my death slumbers be, where my
mother's prayer
And a sister's tears will mingle there,
Where my friends may come and weep
o'er me,
O bury me not on the lone prairie.

O bury me not on the lone prairie,
In a narrow grave just six by three,
Where the buzzard waits and the wind
blows free,
Then bury me not on the lone prairie.

There is another whose tears may be
shed
For one who lies on his prairie bed,
It pained me then and it pains me now;
She has curled these locks, she has
kissed this brow.

These locks she has curled, shall the
rattlesnake kiss?
This brow she has kissed, shall the cold
grave press?
For the sake of the loved ones, that will
weep o'er me,
O bury me not on the lone prairie.

O bury me not on the lone prairie,
Where the wild coyotes will howl o'er
me,
Where the buzzard beats and the wind
goes free,
O bury me not on the lone prairie.

O bury me not, and his voice failed
there,
But we took no heed of his dying prayer,
In a narrow grave just six by three,
We buried him there on the lone prairie.

Where the dewdrops glow and the but-
terfly rests
And the flowers bloom o'er the prairie's
crest,
Where the wild coyotes and the wind
blows free,
On a wet saddle blanket lay a cowboyec.

O bury me not on the lone prairie,
Where the wild coyotes will howl o'er
me,
Where the rattlesnakes hiss, and the
crows fly free,
O bury me not on the lone prairie.

O we buried him there on the lone
prairie,
Where the wild rose blooms, and the
wind blows free,
O his pale young face no more to see,
For we buried him there on the lone
prairie.

Yes, we buried him there on the lone
prairie,
Where the owl all night howls mourn-
fully,
And the rattlesnakes hiss, and the crows
fly free,
O'er his lonely grave on the lone prairie.

And the cowboys now, as they roam the
plains—
For they marked the spot where his
bones had lain—
Flung a handful of roses o'er his grave
With a prayer to Him who his soul will
save.

O bury me not on the lone prairie,
Where the wolves can howl and growl
on me,
Flung a handful of roses o'er my grave
With a prayer to Him who my soul will
save.

Another:
Seeing a call in the Cultivator of
February 18th for the "Song of the
Dying Cowboy," I will enclose one
that we used to try and learn the
dogies to trail by back in Montana
some twenty years ago. This is as
near as I can remember it. Possibly
you have had several in already.
Leaving you to capitalize and punctu-

ate same as my schooling was done
on the hurricane deck of a Montana
bronk.—Sour Dough Miller, a new
member to California Cultivator.

COWBOY'S LAMENT

As I rode by Tom Sherman's barroom,
Tom Sherman's Saloon one day,
I saw a young cowboy 'twas dying,
Who called me to his side these few
words to say.

Chorus:

Play your fife lowly, and beat your drum
slowly,
And play a death march as you carry
me along.
Go take me to the prairie, and throw
the sod o'er me,
For I'm a young cowboy; God knows
I've done wrong.

It was once to the saddle I used to go
dashing;
It was once to the saddle I used to
be gay;
But I first took to drinking, and then to
card playing;
Got shot through the body, and I'm
dying today.

Chorus:

Go write a letter to my gray-headed
mother,
And write another to sister so dear.
But still there's another that would
Bitterly weep if she knew I lay here.

Chorus:

Oh, bring me a cup of cold water,
A cup of cold water, the poor fellow
said;
But when I returned his spirit had
parted,
And gone to his Giver. The cowboy
lay dead.

Chorus:

HOUSEHOLD QUERIES

Household Helps from Gilroy Sub-
scriber

"Former Subscriber," Modesto,
writes that the hard soap she makes
has good bleaching qualities but is
hard on the hands. I make all my
waste fat into hard soap and find that
by adding half a pound of powdered
borax to amount made with one can
of lye that the soap is improved and
it does not injure the hands in the
least.

I find many helpful things in your
household department and would like
to pass on some of my ideas to others.

My favorite way of cooking par-
snips is to fry a few slices of bacon.
Cut bacon in small pieces, fry and
turn the bacon and fat into the
mashed parsnips. Beat up well, put
in baking dish and set in oven for a
few minutes before serving.

I also find that rice added to sum-
mer squash is very good as it brings
out the flavor of the squash and takes
up the excess moisture. I boil my
rice Japanese style, viz: dropping it
into boiling water and boiling 20 min-
utes covered closely, drain and add to
seasoned, mashed squash. I raised
Italian squash last year and like it
better than any other I have tried.

I often use rice with left over meat
or gravy. A very appetizing ragout
can be made by combining boiled rice
in any quantity to suit taste with any
kind of left over meat or fish and
gravy seasoned to taste—Subscriber,
Gilroy.

Italian Salami

Have noticed in the Cultivator that
the Lompoc subscriber wishes to know
of a good recipe for salami. This is a
good sausage and salami recipe. If
you want to make salami, omit the
cinnamon and put in a few grains of
whole black pepper. Take equal
amounts of pork and beef as you wish,
taking care that neither is too fat.
Grind the beef and pork separately
and then mix thoroughly together.
These are the ingredients for 32
pounds of meat already mixed:

Salt one pound, pepper one ounce
(ground), cinnamon one-half ounce,
cloves, one-fourth ounce, nutmeg one
teaspoon, saltpeter one pinch; diluted
with a little broth. Garlic, half a cup
ground, one pint wine and the pinch
of saltpeter can be boiled together
with the juice of garlic or otherwise
just let it come to the boiling point.
Then strain this liquid into the meat.
The amount of liquid depends upon
the taste of the person. Mix the in-
gredients and meat thoroughly and
then stuff in beef casings and hang
up. They should not be allowed to
hang in a draft. This recipe has been
used continuously for years in our
family.—Mrs. H. V. Marcetti, Modesto.

It always hurts a young man a little
when some girl he knows tells him
that she is engaged.

properly prepared there is no more delicious fruit- food than PRUNES

11,000 grower-
members

There's all the taste-difference in the world in
prunes when they are properly prepared. And it's
just as easy to prepare them *right*. Perhaps you have
a "pet" way of stewing prunes. But if you haven't
[and even if you have] try this method worked out
by our own Domestic Science Director:

First—soak them over night, if possible—but if
not, for several hours at least. Second—cook them
slowly until tender in the water in which they were
soaked. Third—use plenty of water so the fruit will
be "loose." Fourth—be sure you don't cook them
too long as they will become too soft. Flavor with
an inch stick of cinnamon or some lemon or
orange juice. Sugar is not required, as slow cook-
ing brings out the rich fruit sugar in the prunes.

HOUSEHOLD QUERIES

Hard Crust on Cake

Please tell me the cause of hard crusts on cakes. My cakes are very light but have a very hard crust.—Subscriber, Santa Rosa.

There are several things that might cause a hard crust on your cakes. Too much sugar is often the cause of this. For a plain cake would advise not more than one cup of sugar to a scant cup of liquid. Layer cake ordinarily requires about 20 minutes' baking. Baking in too hot an oven or leaving in too long may be the cause of hard crusts. Baking done entirely on the upper grate of the oven causes this condition, but under those circumstances cake is not as a rule light.

Candied Citron

Will you please print a recipe for candied citron such as you buy at the stores for use in fruit cakes, cookies, etc. We have a citron tree but have been unable to find recipe. Will you please print recipe as soon as possible.—Subscriber, Yorba Linda.

We reprint directions given in California Cultivator of February 12, 1921.

In preparing citron for preserving

it is halved, put in brine for three weeks, and the brine must be strong enough to bear the weight of an egg the entire time the citron is in it. By keeping up the proper strength of the brine, the citron may be kept in storage until necessary to use it, being kept this way many months.

You may not depulp the citron raw, as the fiber between pulp and rind is too strong. The citron is boiled in water from 45 minutes to an hour, which boiling loosens up the pulp so it can be easily removed, with a spoon. The boiling also brings out the salt in the fruit and after it is dipped in two washings of cold water all salt should have been removed.

Now the citron is ready for taking up the syrups. Since the citron has already been boiled in only water for about one hour, its texture is softened up so that syrups can soak through it evenly. A syrup can be prepared thick as honey and the citron boiled in it (do not put into the syrup more than one-half its weight of citron—into 100 pounds of syrup put only 50 pounds of citron), the water in the citron will dilute the strength of the syrup. Hence the water of the citron must pass off as steam during the cooking and at the end of one hour the syrup should be just as dense as

at the start. Now the citron can be removed from its syrup and both allowed to stand for nearly a week in some vessel.

At the end of the first week the cook will find that the strength of the syrup has greatly decreased. Now the syrup should be brought to its proper strength and the citron cooked in it a second time.

Each time the citron is removed from the vessel in which it is cooked to the vessel it is to stand in, the syrup should be of proper strength. This re-cooking should take place as often as the syrup is found below the standard of strength. When the syrup has become constant in density, the citron can be kept stored this way at the desire of the cook as long as the syrup covers the fruit, though it is exposed to the air. Dense syrups are preservatives, but weak ones invite fermentation.

Citron should cure up in the syrup for at least four weeks. After this time the syrup should be drained from it and the fruit allowed to dry upon trays in a dry place away from the sun and the bees. It will take from five to seven days for the fruit to dry.

When it is dried, it is dipped into a crystallizing syrup made from pure cane sugar. This syrup is prepared by dissolving sugar in boiling water until you get a super saturated solution—allow the syrup to stand for five hours when a crust of sugar will be formed upon the top—remove the crust and dip the fruit well. Next lay the fruit upon clean trays and after 24 hours standing a nice crystallization of sugar will cover the fruit. At last the fruit is ready for boxing for shipment.

Prepare your syrups used for cooking three-fifths glucose and two-fifths cane sugar. Cooked in clear glucose the flavor is lost and fruit is too tough. Cooked in straight sugar syrup after standing awhile the sugar crystallizes in it, and transparent condition is lost and fruit becomes brittle.

Orange and lemon peel can be candied according to the same process.

Prune Cake

One-quarter teaspoon soda, 6 mixing spoons bread batter, 1 egg, 1 cup sugar, 1 mixing spoon lard or butter, 2 cups flour, cinnamon and nutmeg to taste, ½ pound pitted cooked prunes cut in small pieces, ¾ cup crushed nuts.

Mix soda in a little hot water, then pour into the batter and stir well. Add egg, shortening, sugar and flour, sift spices in flour, stir well, add nuts and prunes, stirring in slightly. Put in well greased pan and bake in moderate oven one hour.—Mrs. A. Spagnoli, Campbell.

"THE GRIND AND THE STEPPER"

In any kind of school there are two kinds of students, the natural grind and the stepper.

By a grind, I mean a fellow who always has both eyes open for enough trouble in the form of more work with no play. Work is easy to find, but what good does it do to grind away at it continually without rest?

Constant grinding of an ax sharpens it, but it also wears it away.

The same is true with a person continually grinding away at lessons; it sharpens the wits but wears away the health. It also prevents your mixing with your fellow students, a large and important part of your education.

On the other hand, we have the stepper who never misses a dance, a show or a flunk. This kind of a fellow will not amount to much in life because life has to be taken with a certain amount of seriousness to make a success of it.

If it were possible for all of us to strike the dividing line between these two classes we should approach being perfect students. We should try, at least, to make such a balance our goal. Then when we graduate we have not only some knowledge of books, but also a collection of school life memories and experiences with our class work, but neither can take the place of the other.—P. McD., in P. H. S. Agricultural News.

HINTS FROM HOUSEKEEPERS

Some of Our Favorite Recipes

I enjoy the household department and have used a great many of the recipes. Thought some one might like to try some of my favorites that are just a little different that I have been using for years. Success to the paper.

Onion Souffle.—1 cup boiled onions, ½ cup bread crumbs, 1 egg yolk, 1 teaspoon chopped parsley. Make white sauce of 1 tablespoon each butter and flour, 1 cup milk, ¼ teaspoon salt. When it boils add to it the onions, etc. Fold in beaten white of egg and bake 15 minutes.

Two Ways of Serving Cabbage.—Beat 1 egg, add ¼ cup sour cream, ¼ cup vinegar, 1 teaspoon sugar. Stir together and pour over cooked cabbage and just bring to a boil. Heat a lump of butter until well browned. Put the cooked cabbage in serving dish, pour the hot butter over it just before sending to table.

Casserole.—Use round steak, cut in pieces for serving. Roll in flour, fry brown, put in bean pot or baking dish. Fry 1 large onion, add to the meat. Make a quantity of thin milk gravy in the skillet, pour it over the meat and bake slowly for at least two hours, or until meat is very tender.

Sour Cream Cake.—1 cup sugar, 2 eggs, 1 cup sour cream, 1½ cups flour, 1 level teaspoon soda, a little salt and flavoring. This is good when baked in muffin pans or in layers. ¼ teaspoon of baking powder may be added if desired.

Prince of Wales Cake.—½ cup shortening, 1 cup sugar, 2 egg yolks and 1 white of egg, 1 cup milk. Sift flour five times, measure out two cups and add 1 level teaspoon soda, ½ teaspoon cloves, 1 teaspoon cinnamon and sift into cake. Add 1 cup chopped raisins, 1 teaspoon vanilla. Bake in layers.

Filling. 1 cup sugar, 4 tablespoons water and boil until it threads. Beat this slowly into the well beaten white of one egg. When not quite cold add ½ cup raisins and a little vanilla.

Marmalade Pudding.—½ cup sugar, ½ cup butter, two eggs well beaten, 1 cup flour, pinch of soda, 3 large tablespoons orange marmalade. Steam ¾ of an hour and serve with whipped cream or hard sauce.

BOOKS AND BOOKS

Here is a characterization of some of our modern books which we found in a recent Saturday Evening Post. The crudity of the expressions seems particularly appropriate:

"Come si' down. Tell me. You said they larned you to read, in there. How's that?"

Salem tried to explain. "I mean sir, it came over me," he replied, "that books were like a man talking to you, say."

Captain Constantine put away his convex mirror, and grunted.

"Some is. Some hain't," he declared. "Some's more like a infant teethin', and others like a spoilt monkey that needs him a dose o' physic. Good ones, yes; good one is men."

And how about the movies?

What genial friends, what faithful guides and counsellors good books are! And there is no time for forming the habit of reading good books better than childhood. If you stop to think it over, don't you remember that most of your reading of books was done in your youthful days when the pressure of living did not fill all the hours? Get the children started early and started on the right books.

IT HAPPENED IN MONTANA

In Montana a railway bridge has been destroyed by fire and it was necessary to replace it. The bridge engineer and his staff were ordered in haste to the place. Two days later came the superintendent of the division. Alighting from his private car he encountered the old master bridge builder.

"Bill," said the superintendent—an the words quivered with energy—"want this job rushed. Every hour delay costs the company money. Have you got the engineer's plans for the new bridge?"

"I don't know," said the bridge builder, "whether the engineer has the picture drawn yet or not, but the bridge is up and the trains is passing over it."

CAUTIOUS

Lawyer: "Would you vouch for the defendant's integrity?"

Witness: "We-e-ll, not exactly, but I ain't never caught him doing nothing."

Livestock News Notes

LIVESTOCK SALE CALENDAR
Holsteins
April 5, Guaranty Sale, Rhoades & Rhoades, Pavilion, Hynes.

Manager James A. Brown of the Brown Ranch, Capitola, writes of a record making Guernsey of his herd. She has been allowed by the University of California tester a percentage butterfat test of 9.96. This was on our Guernsey cow Imported Miranda III of the Houards." Mr. Brown says the herd includes 50 registered Guernseys, mostly of the former herd of Judge Curtis H. Lindley. The head of the herd is a young bull, Floridale Secret King, 69579, secured at the last national dairy sale, whose sire is Merry May King and whose dam is Floridale May Rose.

R. T. Jackson, of the United States biological survey, verified a report of rats killing calves in Umatilla County, Washington, which was not believed until the actual evidence was seen. Several days ago County Agent Fred Bennion received a complaint from R. C. Rasmussen of Stanfield that wharf rats had killed four of his calves. Upon investigation the assistance of the biological survey was requested. Jackson found that the rats worked in bands, chasing the calves until they were exhausted and then gnawing the flesh above the hoofs, letting the young animals bleed to death. The rats have been exterminated by a special poisoning process.

The secretary of agriculture has issued a formal complaint against every livestock commission firm that is a member of the St. Louis Live Stock Exchange and against the principal order buyers, dealers and traders at the St. Louis National Stockyards, about 110 in all, who have refused to do business with independent commission companies not members of the exchange. They are cited to appear to show cause why an order should not be issued against them under the Packers and Stockyards Act, to "cease and desist" from the practices complained of. This is the first formal complaint issued under the Packers and Stockyards Act approved August 15, 1921, and its issuance is the outgrowth of a considerable amount of complaint at the St. Louis market, and came only after it was found that an informal adjustment could not be secured. The principal charge in the complaint is restraint of trade through a boycott, and that the 39 commission firms constituting the entire membership of the exchange refused to do business with order buyers or traders, except the buyers for the very large packing concerns, who buy live stock from the four commission companies that are not members of the exchange.

The Holstein-Friesian cow Dutchland Pietertje Vale has just closed a long time test and is credited with 27,939.2 pounds milk containing 1,010.42 pounds fat in 365 days, thus showing an average of 3.62 per cent fat in the milk. She freshened at five years, one month, seven days. Her sire is Dutchland Sir Pietertje Hengerveld; her dam Dutchland Colantha Vale. She was bred and is owned by F. F. Field Holstein Trustees, Brockton, Massachusetts. Her 365 day fat production of 1,010.42 pounds equivalent to 1,263.02 pounds butter on the 80 per cent basis, gives her 40th place among cows producing above 1,000 pounds fat, she being the 47th cow to gain the high honor of producing more than 1,000 pounds in 365 days.

Among recently completed records made in the herd of the Los Angeles County Farm is that of Lilith DeKol Tritomia, purchased at the Toyon Farms dispersal sale last April. Freshening at the age of three years one month, she made a seven day record of 27.35 pounds butter from 578.7 pounds milk. Continuing on 30 day test she made 106.69 pounds butter from 2,368.3 pounds milk. This heifer was sired by the son of Jessie Fobes Bessie Homestead, the first cow to make three records over 33 pounds. Her dam is an A. R. O. daughter of Hollywood Lilith Palmyra, who has

five daughters with better than 30 pounds records as three and four year olds. Laconner Pontiac Evangeline, a senior four year old, made 24.53 pounds milk in seven days from 495 pounds milk and is starting out well for yearly test, at the present time milking well over 80 pounds per day. She is out of a 30 pound cow with a 12 year old record of 798 pounds butter in 365 days, and her sire is a brother to Miss Aaggie Acme Burke, the famous champion two year old, who is the dam of the \$41,000 bull. A two year old daughter of Toyon Fayne Valdessa was tested for seven days, 8½ months after calving, producing 14.6 pounds butter.

The University of Arizona has a Holstein cow, Theresa Belle 3rd, which recently completed a splendid year's record, having made more than 800 pounds fat, the equivalent of more than 1,000 pounds butter in one year. When she was fresh she ran seven, 30 and 60 day records and produced in seven days more than 29 pounds butter, and in one day 117 pounds milk. She averaged for one week more than 13 gallons milk per day.

Blackhawk Ranch, Diablo, has sold to Adolph Eddlemon of Lodi the two-year-old Shire stallion, Blackhawk Admiral. The sire of this colt is Dovecote King and his dam is Blackhawk Blossom. Blackhawk Blossom was sired by Lockinge Blagdon and her dam was Hawton Felicity. It will be recalled that Blackhawk Blossom won the class at the P. P. I. E. for the best single horse weighing 1400 to 1600 pounds.

Professor John Evard of the Iowa state agricultural college, and probably the best known swine expert, is now living at Monrovia. For several years Professor Evard has been in failing health, and it is expected that an indefinite stay in Southern California will effect a permanent cure. Professor Evard pioneered the plan of self-feeding swine and has been responsible for hundreds of feeding experiments.

Secretary Chas. Paine of the state fair board has compiled an 80-page booklet of the complete list of awards made at the last state fair. The data is most complete, and in addition to the livestock awards gives the breeding of the winning animals. It is thought that this is the first book of the kind ever issued and it is certain to be of great value to the livestock interests. Copies may be had by addressing the secretary.

A new world's record for butter fat production for heifers freshening under 24 months of age has been established by the Holstein heifer, Daisy Aaggie Ormsby 3d, a daughter of Sir Pietertje Ormsby Mercedes 37th. Her production figures are 870.63 pounds fat and 22,151.2 pounds milk. The former champion was the Jersey heifer, St. Mawes Lad's Lady, with 829.09 pounds butter fat.

Lady Roberts Colantha, a senior three-year-old Holstein heifer, owned by J. B. Hammer of Canada, has established a new world's record for cows under full age when she produced 1468.75 pounds butter and 26,433 pounds milk in 365 days.

Charles Weeks of Palo Alto has gone in for Guernseys. To head his small herd he has purchased from Brant Rancho, Owensmouth, Golden Glow, the undefeated junior bull calf on the California circuit this past year. He is a son of May King of Fern Ridge, Brant Rancho's senior herd sire that has been twice grand champion of California and this year was the same at the California National. The dam of Golden Glow of the Rancho is Golden Glow of Highland, a splendid big cow with a good official record.

Frank D. Tomson, Lincoln, Nebraska, who for the past six years has edited "The Shorthorn in America" and had charge of the breed's publicity for the American Shorthorn Breeders' Association, will now give his entire time to his personal affairs. Mr.

Tomson is financially interested in the Woods Brothers' Corporation of Lincoln, which is extensively engaged in the protection and reclaiming of river bottom lands along the Missouri, Mississippi, Sacramento and various other rivers. This publication is advised that he will occasionally write on matters of current interest relating to the livestock situation, as he will continue to be in close touch therewith.

In Dairies

the Country Over

Bag Balm is greatly valued by cow owners everywhere because it is perfect insurance against the troubles that attack the milk yield through the udder or teats.

The slightest cut, bruise, chap or sore will make a cow restless and cause a "holding-up" of the milk. Besides, many serious ailments result from neglecting what may seem like very slight injuries of these milk-producing organs.

Any inflammation, soreness, congestion or hardened tissue will quickly heal and become soft and normal through the penetrating action of Bag Balm. Healthy tissue and normal circulation give the cow comfort and restore a full milk-flow. Caked Bag responds promptly to application of this ointment; equally valuable in treating Bunches and Cow Pox.

For the sake of safety, keep a package on hand; feed dealers, general stores and druggists sell big 10-ounce package at the reduced price, 60c.

Status of Milk Cost Studies

By R. L. Adams

TO date work is well under way in 24 counties, Humboldt, Marin, Sonoma, Napa, Solano, Yolo, Sacramento, Glenn, San Joaquin, Stanislaus, Fresno, Kings, Kern, Los Angeles, Orange, Imperial, Santa Barbara, Monterey, Santa Cruz, San Benito, Santa Clara, Alameda, Contra Costa and San Luis Obispo. Four hundred twenty-four dairies are involved in the study. Thus an attempt has been made to get a cross section of the dairy industry which will include valley and hill conditions, corral contrasted with open pasture, market milk with butter fat, coast versus valley conditions, locations close to cities with remote situations. The work is being handled by three field men giving full time and 24 cooperative cow testers, dairy inspectors, etc., all of whom report in this work to the division of farm management. The method of gathering data is by means of two annual inventories taken a year apart and 12 monthly reports recording in great detail the various expenditures, receipts and charges on each of several hundred dairies involved in the study. By this means the business of these dairies will be watched for the entire calendar year. From the records will be forthcoming a wealth of fact for correlation and use.

Perhaps the most common question asked in this connection is, What is the object of the work and what is it that is to be expected from the results? So far as the college of agriculture is concerned its interest centers around the collection of facts and their presentation. However, the reasons for the study have been neatly summed up by a member of the original committee which secured the appropriation, to show that the objects of the study are: To obtain a knowledge of what milk and butter fat cost; to correct popular idea that dairymen are making excessive profits; to

bring closer relation between consumer and dairymen; provide facts for possible readjustment of the dairy industry.

Quoting in detail he says: "In years past the dairymen have been accused by the legislature, by civic organizations and by the consumers of demanding exorbitant prices for their products. They have been accused of making excessive profits and of getting wealthy at the expense of the health and strength of our growing generation. We have never had accurate data to use in refuting this accusation. We desire now to have data, cost data, the authenticity of which will be beyond question, to show legislators and consumers that we are not making excessive profits or asking unjustifiable prices for our product.

"We wanted to show both the consumer and producer exactly the cost of producing milk so as to furnish a background, a starting point upon which to build a stable industry. We realize the vital need of milk to the people, we realize our responsibility and do not want the supply of milk to cease or diminish. In order to protect that milk supply we want to place dairying on a paying basis, and prevent and remedy the present conditions, under which many men are quitting the business.

"Another purpose was to attempt to establish a means for calculation of feed values. We hope to do this on a basis of the value of the products we produce. The investigation is being carried on, and will give figures both in terms of cash costs this current year and in terms of feeds and hours of man and horse labor necessary to produce a gallon of milk or a pound of butter. Having quantity and some equivalents we can readily calculate the prices we can pay for feeds.

"This survey was started not with the least intention of exposing anyone, or of throwing any shadows, but mere-

ly to give us, as dairymen, figures we can lay before legislators and consumers which will show them we are not profiteers.

"These then were the reasons why we asked the California legislature for an appropriation in 1921. We hope to attain several specific results.

"We want to correct the current hypothesis that we are making excessive profits.

"As a result of this corrected hypothesis we will come into a closer and more cordial relation with those who consume our products.

"We want to know, community by community over the entire state, the cost of production, so that we can tell what type of dairying is feasible in that community. By type is meant method of marketing the product, either as market milk, manufacturing milk, cheese or butter.

"This is a movement started by the dairymen for the benefit of the dairymen and consumers alike. The information obtained will be placed at the disposal of anyone who can make use of it. The success of the investigation depends on the full cooperation of the dairymen. It is the dairymen's investigation; the men who are doing the work are working for the dairymen; the results will benefit the dairymen. Therefore let every man get behind the work and do all in his power to make the survey a success and thus do all that any one man can do to help the industry as a whole."

CALIFORNIA'S LIVESTOCK

Values per head of all classes of livestock on farms in California, January 1, 1922, decreased from those of 1921, according to the annual livestock report issued by E. E. Kaufman, agricultural statistician of the California cooperative crop reporting service. Horses declined 16.3 per cent; mules, 17.1; milk cows, 20; other cattle, 19.7; sheep, 22.1, and swine, 19.4. Horses, sheep, swine and cattle, other than milk cows, decreased in number, while mules and milk cows increased as compared with January 1, 1921.

On farms in California January 1, 1922, there were 367,000 horses, valued at \$30,094,000; 61,000 mules, valued at \$6,222,000; 632,000 milk cows, valued at \$48,032,000; 1,380,000 other cattle, valued at \$47,886,000; 2,450,000 sheep, valued at \$12,985,000, and 834,000 swine, valued at \$9,758,000. All livestock in California on farms January 1, 1922, was valued at \$157,425,000, as compared with \$191,942,000 on January 1, 1921, and \$224,005,000 on January 1, 1920.

The 1922 livestock report is the most complete on California's livestock that has been issued to date and contains the estimated number of all classes of livestock by counties for the years 1922, 1921 and 1920. There has been an increasing demand for yearly agricultural statistics by counties, and it is now the plan of the California cooperative crop reporting service to compile all annual estimates on the county basis. County acreage and production of all field and fruit crops for 1921, together with county data on bearing and non-bearing trees and vines, has been compiled and will be issued at an early date. The new plan, it is said, of estimating crops and numbers of livestock on a county basis will give California one of the best and most complete crop reporting services in the United States. Copies of the complete livestock report and other reports issued by this office may be obtained by addressing the California Cooperative Crop Reporting Service, 1030 K Street, Sacramento.

KERN COUNTY'S NEW COW TESTING ASSOCIATION

Assistant Farm Adviser R. H. Klant of Kern County writes: "Last September the dairy department of the Kern County farm bureau organized a cow testing association which has operated smoothly and successfully for almost six months. The Bakersfield Civic Commercial Association at the last director's meeting appropriated \$100 for prizes to be awarded for the two best herds and the best cow. Following is our report for February:

"Number cows tested, 904. Average pounds of milk per cow, 600. Average pounds fat, 25.6. Number cows

Now is the Time!

Do you realize that it is harder to buy top registered cattle of all breeds today than it has been for years past? That when an owner can be induced to part with some of his best cattle the price inducement must be especially attractive?

There is a sound reason for this condition, for good cattle are scarce all over the country. Experienced breeders everywhere realize that the upward movement toward the greatest demand for registered Holsteins that the world has ever known is definitely under way, and the ones who own the better sorts are planning to keep them and let them multiply for the future market.

Beginners and established breeders alike will be afforded a remarkable opportunity for purchase of top registered Holsteins in

Sunlight in Drums

COMPARATIVELY few of the millions of people who today enjoy the benefits of calcium carbide in home lighting and its many other popular uses know the interesting story of its discovery. And strangely enough, after remaining a sealed secret throughout the ages, this great gift of science to humanity, easily one of the greatest discoveries of the nineteenth century, was revealed at almost the same moment to an American electro-metallurgist and to an eminent French savant.

The American, Thomas L. Willson, so the story runs, was conducting some experiments at Spray, North Carolina, in 1892, in which he made use of a mixture of lime and coal tar, which he heated to a high temperature in an electric furnace in an effort to produce metallic calcium. Instead, the product after cooling proved to be a dark, brittle mass that in disgust he cast into a nearby creek. To his surprise the water began to bubble, indicating the generation of gas below its surface. Upon touching a lighted match to the escaping fumes they at once ignited and burned with a bright flame. And this was the origin of calcium carbide as the product is known commercially today.

In the United States there grew up an important industry devoted to the manufacture and distribution of this product, and in a few years the chemical name of calcium carbide became practically obsolete in this country, the familiar contractions, carbide or Union carbide, being generally used.

Widely Varied Uses

Carbide gas generators have been in use in our rural districts for the past 22 years or more, shedding their comfort and cheer in homes that a generation ago in the half light of kerosene lamps had just emerged from the half darkness of the candle or tallow dip. Carbide has been a godsend to these homes. It has more lately added other conveniences, such as gas cooking and ironing and instantaneous water heating. Carbide tonight will supply the gas illumination for more than a million Americans in more than a quarter of a million American homes.

In the manufacturing and industrial field, where the gas process of welding and cutting is now almost universally employed, carbide is used in enormous quantities for the generation of acetylene, the gas that with oxygen, and used under moderate pressure in a blowpipe, gives the highest temperature flame known.

Not many years ago pleasure automobiles were lighted with compressed acetylene, and practically no car was without its Prest-O-Lite tank on the running board. There are no fewer of these small tanks today than then. Though we rarely see them now, excepting on trucks and tractors and motorcycles, there are really more small gas tanks in use than ever before. They are in the chemical laboratory, in the dental office, in the plumber's and sheet metal worker's kit, on launches and yachts—even in chicken houses! The gas they contain is generated from carbide. But why in chicken houses, you will ask! The answer is to give the hens a longer working day! It is a practical proved thing, and it is becoming more generally known and understood all the time.

And then there is the use of carbide for lighthouses and buoys in the world's seaways! It is not difficult for anyone familiar with carbide lighting in the home to understand how it can be utilized in lighthouses as a safeguard to navigation. What the average person does not realize is how invention has contrived wonderful automatic generating devices with supplementary attachments that make it possible to charge the gener-

ators at intervals of several months and so adjust the mechanism that it will function without the presence of an attendant.

The story of carbide is replete with romance. There seems scarcely an end to what might be written of achievements resulting directly from its many uses. Whether it serve to illuminate with giant flares a grid-iron, as was done when West Point was doing night training for the army and navy football game last fall, or be the means of rescue, as in the case of the tragic Eastland disaster, there is always a story somewhere in carbide or its gas, acetylene. It has been truly called the "gas of a thousand uses."

Calcium carbide is a product of the electric furnace. In this it is not different from the first calcium carbide accidentally produced by Willson, at Spray, North Carolina. There the analogy ends. The relation of the original Heroult electric furnace to the great furnaces at the Niagara Falls plant of one well known manufacturer of carbide would be that of the ivory figure of an elephant on your match fob to the real Jumbo of Barnum and Bailey fame.

There is always a likelihood in writing of carbide that one will become so absorbed in dealing with its extraordinary features that the more homely companion of all these will be overlooked, that is, safeguarding its use. The leading manufacturers have done this literally so far as purification and safe packing and shipping of the product is concerned. It is after the drums are opened that the care must be exercised. Gas is generated whenever calcium carbide and water come in contact. Like all fuel gases, care should be exercised in its use. It is not poisonous, like city gas, but it should be made only in approved apparatus and only in accordance with the easily understood instructions that are always available to users.

CATTLE SHOWING SCARCITY

By A. L. Spellmeyer

Beef steers are reported to have reached the eight cent mark in Los Angeles. List carcass prices have been considerably advanced. Carcass prices of 14 on steers, 13 on cows, 25 on lambs and 15 on hogs are strong for a still further advance. With beef loins listed to 30 cents and lamb to 32 retail prices show no advances. The mills are grinding and Los Angeles consumers in the residential districts report an exceedingly courteous effort for trade with price declines instead of advances.

It is reassuring to be able to forecast results. The eight cent beef prices came upon schedule. The statement made some months ago that the retail business would yet be the end that paid and that a lot of fixtures would be for sale owing to the numbers crowding into it is proving true. Last Sunday's papers showed an assortment of meat shops and fixtures offered for sale. The sinecure with meat that cost about ten cents and sold at 40 has passed in the things "that have been," apparently.

Packers again illustrate their power to command the situation if they choose. No wonder the packers opposed entering the retail field. They can get the result without doing so. Deflation and manipulation continue so far as the livestock producer is concerned but there is this satisfaction, that the game is taking lines that are familiar to us in the past. Packers are making a better profit, and they are entitled to it. Retailers are making less profit, and that also is right, but the producers are not getting it yet.

Can the Dairyman afford Hand Work?

HUMAN labor is worth so much more today than the work of a machine that hand-labor would soon drive the farmer into bankruptcy. The dairyman who milks six or more cows can no more afford to milk by hand than he could to spade up an acre lot instead of plowing it.

Cost records on both large and small farms show beyond doubt that profits are increased by the Empire Milker. Cows are benefitted, cleaner milk is produced, labor costs cut 50% or more.

In spite of new improvements, Empire Milking Machines are selling at the lowest prices quoted in ten years.

Can you any longer afford expensive hand-labor in milking? Write today and find out how much the Empire will save you. Ask for catalog 52-M

The Cattle Situation and Problems

By Frank S. Hastings

(What follows is from an address delivered during Stockmen's Week, by Frank S. Hastings, manager of the great S. M. S. ranches of Texas. Mr. Hastings is generally regarded as one of the best informed cattlemen in America, and the message he gives California cattlemen comes from his experience in operating one of the most successful and largest cow outfits in the Southwest.—Editor.)

I AM not in any sense an oracle, nor do I come here to teach California cattlemen how to do business. Perhaps I should define myself as a student of the economics of production and marketing. And I shall focus as nearly as possible on the breeding end. Another thing, too, it is rather difficult to come to a state and give it the "once over" and attempt to tell what are its limitations. I also want to get square about breeds. I am not in any sense an advocate of a special breed, but, rather this,—it does not matter what you use so long as you improve. Personally, I breed Herefords, with an undercurrent of ten per cent Shorthorns, but there is room for the blood of all the great breeds, and it may be merely a caprice as to what one man thinks is the best to use in his business. Therefore I beg of you to understand distinctly that because I do a certain thing I do not mean that all should. In my own business I breed 90 per cent Herefords and ten per cent Shorthorns. I am criticized because I do not breed all Herefords, and because I do not use all Shorthorns. My only reply to this is that in this "mongrel" breed I have accomplished this result, the highest dressing record in the world for all time, the highest price which any carload of cattle for a show has ever attained, 50 cents a pound, and the highest price for any carload of cattle that has been sold on the market, \$21.50. If I get a result of that kind why should I change? I say this to all, no matter what you breed, breed up and use all of the great breeds.

I am very glad to state at this time that I can see a light in the window. I can see lights in the front window and lights in the kitchen. There never has been a time in my memory of 20 years when cattle were so scarce, and added to that I think we have turned a corner on consumption. The greatest blow which has come to the cattle world in the last four or five years has been in the waning consumption of meat. It began at the time of the war, perhaps, although before that and for a long time, we were told that we were "eating too much meat." If you go to a doctor he will give you the same advice he gave to the letter carrier, "you need exercise." He will tell you you are eating too much meat. I am not finding any fault with those people. They are pushing their own project, and it is legitimate. You take the cereal manufacturers, "one pound of their product is worth a pound of meat," and I got quite a shock when I read that "one pound of macaroni is equal to one pound of meat." I am not criticizing—if you are going to sell a thing you have to boost it or voluntary or involuntary bankruptcy will be bound to find you.

I was making an address before an association in 1917 and called their attention to the fact that we must bring meats back on the map. They are doing it. They are putting out some good publicity, and the press of the country in a way is advocating or rather exploiting the fact that meat is not as bad as it has been pictured. Our friends in the dairy business have always a million each year for exploiting their products. They brought up the matter of vitamins. Meat contains no vitamins, and vitamins are that—not undiscovered, but perhaps—undefined product in human food which is most necessary for the young. The cry has been, "eat lettuce; use milk in all its forms, it contains these valuable vitamins which are needed for the growth of the young." It is certain that if the mothers of families become convinced that they should feed their growing children something that contains vitamins, the rest of the family will be eating the same product. The Meat Packers Institute has published a very powerful pamphlet in which they go into the scientific end of it, and now we discover that meat has vitamins.

I believe, too, that the American people who are a meat eating race have eaten all the macaroni they are going to and are now going back to a chop or a piece of tenderloin steak. I think it is the duty of every man who is connected with the meat industry to use every opportunity he may have to exploit the fact that meat should have its place in the home economy.

As to the scarcity of cattle, I refer to this from a very personal standpoint. I do not suppose there is a desk in the United States that can tell you more definitely of the demand for cattle than mine, that is, for the calf or yearling, and in the 20 years that I have worked in 30 states I have never known such an overwhelming demand or greater scarcity of cattle. Texas has practically no cattle and demands have come from all states, demonstrating that the men in the cornbelt must have cattle to eat up their enormous corn crops. I am keeping two men busy saying that we have no cattle and telling them we do not know where they can find cattle. The state of Texas is almost barren of calves and yearlings. It is so in every state. This is at least important in comparison with last year when there was a stagnation. The thing that was most needed was movement. There was practically no movement of cattle last year at this time. There is the great Northwest, Montana, the Dakotas, with worlds of hay, and practically no cattle. There is no question now about getting loans for the purchase price of cattle. There is another thing of great interest. The demand for breeding heifers is absolutely overwhelming. Fortunately in Texas the ranges are very good, the weather is not especially bad, and practically every man who has cattle can carry them through.

My friend, J. E. Poole of the "Breeder's Gazette," said I told him it would take five years for Texas to get back to normal. I notice in another article of his that range cows have advanced from ten dollars to \$20 in the last month or so. I guess he is right. I do not mean that that is supported by the cattle movement, but a man who wants to buy heifer stuff would have to pay about \$20 more than he would in the summer.

In some correspondence before coming out here, I was told there was very little incentive for improvement in the California herds. Again do not misunderstand me, in speaking of improvement I do not mean crosses, but perhaps you can stand some improvement in your herds. A man may not get any better price for good stock, but he loses sight of the fact that he is paid for more pounds over the scale. Perhaps he is not much helped by sale improvement, but the instinct of a beef animal is to make pounds, just exactly as the dairy cow's is to make milk. If an animal's instinct is "beef," it means she will produce pounds at a lower price than a poorly bred animal and can be kept cheaper than an inferior animal, and eventually you will find that you get your money back for the small expenditures you make and for the losses you incur in culling your herd. As sure as the world is here, the fellow who has his mind fixed on producing something better will get his return.

I remember 20 years ago when I went to the cornbelt section with the statement that all the cattle of Texas were well bred, I was the laughing stock of the cattle world. Today the feed lots of the corn belt are filled with the cattle off the ranges of Colorado, Texas and Oklahoma. The bulk of the cattle in Texas are well bred. There are a great many small herds and they are just as good as any in the state. They have been willing enough for the last 25 or 30 years to come to us for bulls. The industry in Texas, taken from the Texas Pacific railroad up, is bred to a very high standard, and they all get their reward. Range bred herds have won the grand championship a number of times. We were fortunate in this ourselves. In the last four or five months California has drawn something like 2,000 cars of cattle from Texas ranges.

As near as I can understand it, your season here is from about the first of November on to, say, the first of April. You have a rather meager feeding industry. Yesterday we had a meat cut-

ting demonstration here of a heifer and steer that had never had an ounce of grain since they were calves, and it took a practiced eye to tell them from corn fed animals. They were what you would call top cattle in almost every way. As I said, I am not here to teach you your business, but if that can be done on alfalfa hay and without any concentrate it does seem to me that there is a great feeding possibility here when you are improving cattle of about three or four months. I understand that in California there are four or five year old cattle still on the ranges. From my standpoint there should not be in the producing herd anything over two years. The whole tendency is toward young cattle. At the International 20 years ago nothing under three years old won championships, then they dropped to two year old stock, and now I think nothing but a yearling has had a look in for the International grand championships. Almost invariably they pay the top prices for cattle about 18 months old, which are taken as calves and fed a period of 11 months. With that tendency toward the younger heifer, the economy is apparent, for if you can get as many pounds out of an animal in the three year old period here as you can in the four or five year old period, I think the mathematics speaks for itself. The young animal has come to stay. There is an immense feeding of calves, heifer calves, for the reason that during the spring and early summer fat yearlings on the Chicago market sell mixed without any discrimination. These are things which, of course, I do not know are possible here, but they are well worth studying.

You can get good bulls, if you have the price, on very short notice. It is just a matter of going where they are and buying them. But when it comes to the maternal side of the herd you must accumulate. You probably can go out anywhere and buy a great herd of breeding cows, but to accumulate a great breeding herd it is absolutely necessary to go through a severe process. I suppose I am known as the

Easier

Quicker Better

THAT mean, disagreeable job of whitewashing and disinfecting in

Stables Dairies

can be turned into pleasant rainy-day work that will be done in half the time with better results and with less labor.

Carbola is a white paint and disinfectant combined in powder form, that is ready to use as soon as mixed with water and is applied with brush or spray pump. It will not clog the sprayer, has no disagreeable odor and doesn't flake, blister or peel off. It can be used on wood, brick, stone, cement or over whitewash.

DIAMOND G HEREFORDS

I now offer 10 extra good open registered heifers, at real bargain price, sired by a son of an International Champion. Start your herd with these.

H. H. Gable

Esparto, Cal.

"great maternal crank," but the man who overlooks the maternal side of any breeding problem is apt to go back. In my own work I do not keep a cow that does not nourish a calf properly. She goes to the block if she will not produce properly. If you have a cow that does not nourish her progeny carefully, you cannot expect to make a record with her. I never keep the calf of a two year old heifer, but in spite of that, two year old heifers have calves. They all go to the block first, because the life and quality of the animal you are going to retain is influenced by the fact that she is not yet able to drag a great husky calf and give it the proper nourishment. While some of them look fine, they do not make as good beef cattle as a calf from a three year old heifer. In making our selections in the accumulation of great breeding herds we do not work entirely from the physical conformation. This is the greatest mistake that any breeder can follow. The bonnet you buy for your wife for next Easter is going to come from cattle you put on the block. Therefore you can afford to make any sacrifice in order to obtain that result. We go probably more by get than anything else, and it is almost uncanny how the man who has been with the herd can easily pick out a cow and say "She had a poor calf last year," or another and say "She had a fine calf last year and the year before." It is uncanny but true. The thing is to follow up the cow and know whether she had a good calf.

Often times in showing cattle people say, "Why did you keep that cow," pointing to one. I may be more than 100 yards away from the cow, but I can always say when we get to the cow "She has an outstanding calf." Invariably it follows that if you see a cow in the herd and perhaps wonder why that cow was kept, that cow has had an outstanding calf, and as long as the cow will produce for me the thing by which I get my bread and butter she stays in the herd during her period of usefulness. I would say this, on the maternity side of your herd take your medicine, cull out the inferior stuff, and that is the only way to accumulate a great herd.

I have only touched the edges. If I can, I want to leave this thought. It pays to improve your herd, no matter how. Do not lose sight of the maternal end. Cull out until you get a race of producing cows. If the cow is the best cow in your herd and produces a calf that does not produce anything, send her to the block. And in regard to the breeds, use them all, but always with your eyes to the stars.

ANNUAL HOLSTEIN CLASSIC, A STAR EVENT

That the attention of western Holstein breeders is focused on the annual guaranty sale to be held at Hynes, April 5, is indicated by the fact that Sales Manager C. L. Hughes reports a wider demand for catalogs than has been evinced for any sale during the past year. This widespread interest can be interpreted as an expression of confidence in the future of the Holstein and appreciation of the efforts of members of the California Holstein-Friesian Association to contribute a class of cattle of outstanding worth.

The 65 head cataloged were carefully selected from 20 of the leading California herds and represent more herds than have ever figured in any former sale. Furthermore, the committee of selection states that the average quality of the cattle listed is in every way up to the standard of former sales. For the most part the females will consist of young cows with substantial records and bred heifers of acknowledged worth. A feature attraction among the females will be found in Norma Korndyke Cornucopia, whose record of 38.41 pounds butter in seven days distinguishes her as the highest record cow ever sold at auction on the Pacific Coast. Three other cows with records above 30 pounds are listed, and more than 20 others with records from 21 to 29 pounds appear in the catalog. The reference sires, to which the offerings are bred, make a rather formidable list and include many of the acknowledged leaders of California. But six young bulls have been catalogued, and they were each selected with reference to their breeding and individuality.

This will be the first time that this annual classic has been held in Southern California, and for that reason it

is expected that many buyers will take advantage of the opportunity to attend the sale and at the same time visit the distinguished herds of that section that now boasts of owning more high record bulls than are to be found in a like area in America.

The sale will be held at Rhoades & Rhoades' sale pavilion at Hynes, which is 17 miles south of Los Angeles on the Downey-Long Beach boulevard, and will be managed by the California Breeders' Sales & Pedigree Company, Sacramento.

ANNUAL MEETING OF CATTLEMEN

March 25 has been set as the date for the convention of Zone V of the California Cattlemen's Association. The meeting will be called to order by President Hubbard Russell at 1:30 p. m., Saturday afternoon in the lecture room of the Chamber of Commerce Building, Los Angeles.

Instead of holding the regular semi-annual meeting of the state association it is planned this year to hold five meetings, one in each zone. The meeting on March 25 will therefore be an official meeting of the state association as well as a special meeting of Zone V to adopt definite plans for the future. An exceptionally interesting program has been arranged, and the cattlemen will be addressed by some of the ablest men in the country on various phases and issues of the livestock situation.

J. E. Wilson and R. D. Moore of Ripon have just purchased a fine young bull from the Waikiki Farms of Spokane, Washington. This bull is a thrifty individual, of fine conformation and good breeding. His sire is Count Foxy Lad of Waikiki, who is undefeated in the show ring of the Northwest and is out of the wonderful cow Eminent's Foxy Belle, with 816.6 pounds fat as a senior three year old. The dam of this young bull is Comassie's Golden Lucy. She has proved her ability as one of the foundation cows of the Waikiki herd. She is the dam of Pilot's Model, the grand champion cow with two gold medals to her credit, making 746 pounds fat as a three year old. This bull should put both production and type into the herd of Mr. Moore and Mr. Wilson and we wish to congratulate them upon securing such a bull for California.

Two more daughters of King Korndyke Pontiac 20th have made excellent records in the herd owned by W. J. Higdon, Tulare, both first calf heifers. Coloma Beauty Butter Maid 2nd made 21.63 pounds butter from 486.4 pounds milk in seven days as a senior two year old, and Winifred Hotaling Pontiac made 25.04 pounds butter from 480.3 pounds milk in seven days as a junior two year old. It will be noted that both heifers averaged nearly 70 pounds milk per day. Herdsman Tom Graham will continue these on long time test and has a most attractive lot of daughters of King Korndyke Pontiac 20th yet to freshen with their first calves.

Louise Alcartra Prilly, that lately made a world's record production of 40.19 pounds butter in seven days as a junior three year old in the Bridgford Holstein Company herd, Patterson, has now annexed another world's record by producing 151.32 pounds butter from 2,615 pounds milk in 30 days. She will be continued on long time test and with the wonderful start she is making promises a great record.

John A. Bunting, the popular secretary of the Pacific Coast Hereford Cattle Breeders' Association, reports the birth of a tailless calf and cites the instance as further proof of the possibilities in Hereford breeding. One group of breeders has eliminated the horns, and Bunting's friends are wondering whether he plans to go the polled men one better and develop a tailless strain. Bunting may decide to show this youngster, as it is certain that he will not be a tail-ender in class.

MILK IS ESSENTIAL FOOD

Announcing results of experiments in the agricultural chemistry laboratories of the Ohio state university, Prof. J. F. Lyman reports feeding tests on white rats which bear out the dairy

farmers' contention that "there is no substitute for milk."

Twenty-seven white rats, animals raised especially for experimental purposes, were taken to the Columbus laboratories and divided into groups of nine. The first group got bread and milk, the second bread and meat, the third bread alone.

The test ran 18 days. At the end the milk fed rats had gained an average of 38 grams, the meat fed rats had put on 27 grams, while the bread fed

groups showed advances of only three grams.

Moreover, the milk fed rats stayed sleek and strong, while those kept on bread alone went all to pieces and would have died, Dr. Lyman says, had their diet not been changed.

Dietetic investigators all over the country find that food which is good for rats is good for human beings and that laboratory results on rodents are reflected accurately in food tests on human subjects.

SEMI-DISPERSAL 65 REGISTERED HOLSTEINS

T. J. GIST & SONS HERD

Tulare, Calif.

Wednesday, April 12, at 10 A.M.

In order to rearrange their farming operations, T. J. Gist & Sons will sell at public auction their entire herd of registered Holstein females of milking age, a choice lot of bred heifers, and a good lot of young bulls, retaining their unbred heifers and heifer calves as the nucleus for their future herd.

Considerable official testing has been done in the herd and the sale offers a substantial number of young cows and heifers with official records up to over 26 lbs. butter in 7 days.

A FEATURE OF THIS OFFERING IS THE FACT THAT IT INCLUDES 35 ATTRACTIVE COWS AND HEIFERS BRED TO KING SYLVIA SEGIS COLANTHA, WHO IS A SON OF THE \$106,000.00 BULL CARNATION KING SYLVIA AND OUT OF A GOOD RECORD DAUGHTER OF DUTCHLAND GOVERNOR SIR COLANTHA, ONE OF THE BEST PROVEN SONS OF COLANTHA JOHANNA LAD.

The breeding represented in this herd is that of some of the most desirable producing families and the cattle will be offered in excellent physical condition.

Every animal guaranteed to be a breeder; no tuberculin test certificates.

Responsibility of Leadership

One man conceived the idea of the gas and oil service station as a means of acquainting the public with the ideals of a big corporation. His idea at first scoffed at is now exemplified in thousands of such stations.

Byron Jackson Iron Works, not unmindful of the obligation of leadership bestowed by the agricultural world, is endeavoring in a less spectacular way, to give pump owners first hand knowledge of Byron Jackson ideals.

This is being done through a service department manned by the same engineers who have given Byron Jackson pumps world fame.

A system of service cars operated in the more thickly settled agricultural districts assures prompt and efficient attention in time of need.

What and Why is the Piston Ring

HEREVER power is produced by pressure exerted on a moving piston, whatever the type of engine, motor or compressor, its effectiveness is determined by the piston rings.

Upon the piston rings depends whether all the force that is put into the cylinder—gasoline in the case of automobile motors, steam in steam engines, air in air compressors, etc.—is used to create power, or whether part of it escapes and is wasted. Upon the piston rings also depends control of cylinder lubrication; whether or not more oil than is needed to properly lubricate works up the cylinder walls to form carbon and, in gasoline engines to foul spark plugs and make smoke.

All pistons are necessarily made slightly smaller than the cylinders in which they operate. They must be enough smaller so that when they become heated in service they will not bind in the cylinder.

Piston rings are light springy bands of cast iron that are fitted into grooves in the piston. It is their function to close and guard this space between the piston and cylinder; to spring out against the cylinder wall with a definite, firm contact, equal at all points of their circle, so that there can be no escape between piston and cylinder wall for the power that drives the piston, so that no excess lubricating oil can creep up the cylinder walls to make trouble. Upon the equality of their tension against the cylinder wall at all points depends not only the maintaining of compression and restraining of excess oil but also maintenance of round and true cylinders. Rings of imperfect tension that bear more heavily at one point than another mean unequal wear on the cylinder

walls and out-of-round cylinders eventually.

Each ring should form a complete and concentric circle in perfect adjustment and conformity to the bore of the cylinder.

Not only is there waste of power where poorly fitting or worn rings permit gas to escape past them, but their gas condenses in the lower part of the cylinder, working then down into the crank case where it mixes with the lubricating oil. Gasoline is not a lubricant. It deteriorates the lubricating oil and the result is unnecessary wear in the motor because of ineffective lubricant.

Equal tension, uniform pressure outward from the ring's center against the cylinder wall at every point of its circumference, is the basic requirement for a piston ring properly designed and made to develop and maintain maximum compression and maximum fuel economy. The weakness of any piston ring design that does not produce this equality of tension is easily seen. The pressure against the piston ring of the compressed gas in the cylinder is the same at all points of the ring's circumference. It is in no place greater than it is in another. Therefore, it is obvious that a ring's pressure against the cylinder wall should be the same everywhere. If its tension or pressure against the cylinder wall is greater at one place than at another there is friction loss at the point of great pressure, which means loss of power and possible gas leakage at the point of least pressure. Merely closing its expansion vent by flanges, or a locking device or stepping the joint does not prevent leakage past the ring which has not equal tension on the cylinder wall.

Transportation Act

By J. L. Browning

Through processes established by the transportation act the value of railroads has been increased approximately \$5,000,000,000 above the market value of all railroad securities, that is, as the result of the transportation act it is estimated that the railroads are worth \$18,900,000,000 instead of approximately \$14,000,000,000, the maximum estimate of the market value of railroad securities in October, 1921.

On this value the transportation act requires the interstate commerce commission to fix freight and passenger rates in an amount that would produce a return to the owners of 5½ to 6 per cent, which is equivalent to about 8 per cent of the real market value of all railroad securities.

An amendment submitted by Congressman Kendric of Wyoming would, if adopted, repeal that provision of the act and remove that arbitrary limitation on the commission in fixing rates and thus make it possible for the commission in considering transportation needs of the country not only to have regard for the interest of the carriers but to consider the needs of the shippers and patrons of the road as well as the rights of the general public.

The increase in freight rates provided under the arbitrary provisions of this act have actually proved detrimental instead of beneficial to the railroads themselves. Instead of increasing revenue for the roads it has decreased the returns by limiting the volume of traffic; also as prosperity departs from the producer he ceases to be a purchaser of the things the railroads carry. This is clearly shown in the report of freight commodity statistics prepared by the bureau of statistics of the interstate commerce commission.

The number of cars of merchandise of all kinds was 855,006 less during the first six months of 1921 than during the same period in 1920. There were 6,644,005 cars less freight moved during the first six months of 1921 than during the first six months of the previous year. In the region west of the Mississippi the decline in the volume of freight was more than 2,500,000 cars in a single year. The revenue in that district for the first half

of 1921 was \$1,022,807,701, as compared with \$1,105,032,814 for the same period of 1920, a decrease of \$82,225,113. Undoubtedly the production of farm products was equal to that of the previous year, but many of the producers were unable to ship their products because the freight rates consumed the receipts for the products when they reached the market.

SHAMEL ON SUGAR

A. D. Shamel is in Hawaii after the sweet stuff in sugar cane. A recent letter written from the Hawaiian experiment station, says: "I find our work here even further advanced than I had dared to hope. This year we have requests from all the large plantations for bud selection work. This means that we help them pick out superior stools of cane for progeny fields. From the best progenies the second season we again pick out the best stools for additions to the progeny field. After we have made our selections from the progenies, the plantations use all the rest of the stools, except the very poor ones, for plantation seed."

Our work is really divided into two phases: investigational and commercial. In the investigational work we study bud variations, develop methods for the selection of superior stools, establish standards of selection, measure progress, and compare the behavior of progenies. In the commercial work we cooperate with plantations, they furnishing at least one trained man and as much labor as is needed in the planting of progeny fields with seed pieces secured from superior stools. The superior stool is the one that produces the most sugar. Usually it is the one having the largest number of heaviest stalks. The stools having uniformly good stalks are proving inherently good ones. It looks as though we were going to demonstrate upon an industrial scale remarkable improvement in yield of sugar through systematic bud selection."

SUDAN CROP WORTH MILLIONS

From an eight ounce package of seed, introduced from Africa in 1909 through the efforts of C. V. Piper of the United States department of agriculture, the growing of Sudan grass has rapidly increased until in 1918 the value of the crop was estimated to be \$10,000,000, and its popularity is said to be greater here than in its native country. It is particularly well adapted to semitropical regions and the warmer parts of the temperate zones, but it has been grown with some success as far north as Southern Alberta. Since its introduction by the department in this country it has been tried with good results in Australia, South America, the Philippine Islands, Hawaii, Porto Rico and Cuba.

In a recent department bulletin, 981, Sudan Grass and Related Plants, published by the department of agriculture. H. N. Vinall and R. E. Getty have given extensive information regarding the history, adaptation, growing and utilization of this plant and some related grasses. Sudan, however, is far the most important, and the others have been treated only briefly. This new grass has proved best adapted to the southern half of the Great Plains in the states of Texas, Oklahoma and Kansas. It does not succeed well at high altitudes nor within 200 miles of the northern boundary of the United States. It has a high water requirement, but it withstands drouth well and recovers quickly when rain comes.

Sudan grass is admirably adapted for use as an emergency hay crop and is rapidly supplanting millet in many states. It is being used successfully by thousands of farmers as a summer pasture. For this purpose there are few crops that give better returns and serve so well to supplement the permanent pastures and the feed lot.

The bulletin outlines the results of numerous feeding experiments with Sudan grass. In these experiments it was demonstrated that Sudan grass hay compares very favorably with other well known hays in feeding value, especially as a roughage for work horses and stock cattle.

At present seed production is unprofitable on account of low yields and uncertain price. Yields of seed are highest in Western Texas and in the irrigated regions of New Mexico, Arizona and California. In growing the seed a great deal of care is necessary to prevent hybridization with the sorghums. When intended for seed it should never be grown on a field that has produced sorghum the previous year, and the field should be at least 80 rods from any field of sorghum.

WORK ON NATION'S HIGHWAYS

Highway construction will not be delayed by the requirements of the new federal highway act. The federal highway system will consist of roads not exceeding seven per cent of the total in any state, designated by the state and approved by the secretary of agriculture. Work is being rushed by all the highway departments on the preparation of maps of the proposed system, but naturally such an important matter will take some little time and consideration. The government authorities will insist that important through routes meet at state lines which will require conferences between authorities of different states.

In order that work will not be delayed pending the approval of each state system the secretary of agriculture has amended the rules and regulations for federal aid to permit the immediate construction of such roads as it may reasonably be anticipated will become part of the system.

State highway officials are being advised that the anticipated route of which the road to be built is a part should be as long as practicable, preferably entirely across the state. A map must be submitted showing the route, other possible routes and connecting routes. If this is found satisfactory the project will be approved for immediate construction.

The state of Washington submitted the first complete state system, and others are expected in a short time.

KROYER BUILT

4-Wheel Drive Insures Greatest Traction Under All Conditions

WIZARD 4-PULL TRACTOR

The Wizard 4-Pull is the only tractor having a rigid 4-wheel drive. This delivery of power to all 4 wheels gives the Wizard all the traction of a track machine—and under some conditions more—but without prohibitive upkeep costs of track tractors.

Built to Last

After delivering normal pull, the Wizard 4-Pull has 35% reserve power. It is built with over-strong parts throughout to support maximum performance.

There isn't a single oil or grease cup on the Wizard—the only tractor that is automatically oiled throughout. A great time saver. Every working part except wheels and fan is enclosed and absolutely protected against dust and dirt.

Keep these two points clearly in mind:

- (1) The tremendous traction of the Wizard.
- (2) Its unequalled durability and low upkeep cost.

For particulars, tear out this advertisement and mail it to us with your name and address.

POULTRY

Profitable Poultry News—Capacity 200,000 chicks, hence prices surprisingly low for quality. One recent order of County Farm Adviser's was 5,000 White Leghorns, 2,500 Brown Leghorns, 850 Red chicks. His orders are coming after two years' extensive trial of our chicks throughout his county. "I had the pleasure of seeing some your Anconas, White Leghorn pullets. They are grand." "Your Barred Rock chicks, bought May, 1919, proved great winter layers." "Can you furnish me 100 Wyandottes or Reds as good as your's last year? There's nothing like them here." These strains, 180-290-egg Leghorns, Rocks, Reds, Anconas, Orpingtons, Wyandottes, Minorcas, Andalusians, ducks, turkeys, yearly lead many egg-laying contests, supply foundation stock, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter laying, profit, guaranteed. Booking for immediate future delivery, below prewar prices. Smallest, largest orders welcomed. Write Profitable Poultry, 13 No. Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

SEEDS AND PLANTS

SUDAN GRASS SEED

(The Great New Hay Crop)

First introduced in the United States 1909 from Sudan, Africa. Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. Pasture. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$5; 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.

Moline and Army trailers. Harness made to order, repaired or oiled. Some good second hand tractors and tools.

For Sale: Rebuilt windmills, tanks, pumps, cylinders. Make galvanized tanks, 400 gal., \$16.25; 600, \$26.25; 1,000, \$36.25; 2,000, \$48.25. Irrigating pipe, all sizes, for less. Why pay more? Demmitt Co., office upstairs, 120 N. Main, L. A.

One 75 H. P. Westinghouse Motor with starter and overload relay. One 15 H. P. Fairbanks Morse motor with starting switch. Drew Carriage Co., Ontario, Cal. Yuba 12-20 in excellent condition at real bargain price. L. M. Railsback Company, 115 S. Los Angeles St., Los Angeles, California.

For Sale—One Hardie Sprayer never used. W. S. Coffin, Ontario, California.

CATTLE

Guernseys—Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Innisfail Herd of Milking Shorthorns. Draft sale of 45 head, May 5th, 1922. 35 females of Register of Merit stock and ten outstanding bulls of age, type and breeding to suit you. J. D. Rowe & Sons, Leesee, Davis, California.

Ridgewood Ranch—Registered Herefords. Chocely bred, big rugged registered bulls of serviceable age for sale in carload lots or singly at attractive prices. Correspondence solicited. Visitors welcome. C. S. Howard, prop.; Otis Cordell, herdsman. Willits, Mendocino County, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Shorthorns bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Polled Herefords and Durocs—Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

For Sale—Small herd registered Holsteins, on semi-official test, T. B. tested. W. A. Walker, Ripon, California.

Herefords—"Veramont Stock Farm," H. M. Barngrover, Prop., Stockton, California.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

BEWARE QUACK TREE DOCTORS

As the old orchard problem becomes more acute there is a tendency to attract the selfish interest of so-called tree doctors who advertise the cure of all tree ailments by mysterious or secret treatments. We have something of a parallel to this condition in the case of the human family. Physical ills are likely to develop which, on account of our lack of knowledge, may be difficult or impossible to diagnose or cure. Here is the "quack's" opportunity! He blandly offers a free diagnosis and makes extravagant promises of a sure cure for all and every trouble. Only the ignorant, to use a mild word, can offer such broad and confident promises as those sometimes made with regard to the cure of all kinds of difficulties in the case of decadent trees. We would suggest that the fruit grower beware of all extravagant claims for success in treating decadent trees until local orchard experience has demonstrated the value of any particular treatment.

When a bit of sunshine hits ye,
After passing of a cloud;
When a fit of laughter gits ye,
And your spine is feeling proud;
Don't forget to up and fling it
At a soul that's feeling blue,
For the minst that ye sling it,
It's a boomerang to you.—Capt. Jack Crawford.

Heaves

We have healthy looking work horse that seems to be getting the heaves. Please let us know cause of heaves and if he can be cured.—Subscriber, Fresno.

Heaves is caused by overeating and stretching the stomach beyond its normal capacity, the pneumogastric nerve goes to both stomach and lungs. Overloading the stomach seems to paralyze that nerve, and the effect is most noticeable on the lungs. It is hard to cure, but the following powders have given good results in some cases: Take one dram arsenic, one ounce powdered belladonna leaves, one ounce powdered digitalis leaves, two ounces powdered nux vomica and four ounces farina. Mix all and divide into 30 powders. Give one powder in the feed every evening.

Bathing a Horse

We have been told that bathing horses by turning hose on them through summer months will weaken them. Would like your opinion regarding this.—Subscriber, Pomona.

It does a horse just as much good to be clean as it does a person. We would advise clipping and then grooming him well with a good brush once or twice a day. Once a week a good bath with soap and water will do him good also. The water should not be too cold and the soap should be all rinsed off and the skin rubbed nearly dry with a coarse towel. If the water is very cold and is allowed to evaporate it will chill the animal and might do some harm.

Ruptured Pigs

Three pigs out of ten that we are feeding are ruptured in the rectum. It protrudes one and one-half inches. What is the cause and treatment?—Subscriber, Alvaro.

The cause is constipation. Press the rupture back in place and feed laxative feed. Alfalfa pasture and sour milk is good for growing pigs. Very little more can be done for them.

VALUABLE INFORMATION ON MARKETING

Far sighted farmers get more money for their livestock and crops by following the law of average prices in the marketing of their products than do those who ignore the seasonal price fluctuations. In the past one of the chief difficulties confronting those who wished to profit by such information was that reliable figures which showed the monthly trend of prices for crops and livestock were not readily available. For that reason "Market Statistics," a 280 page bulletin published by the United States department of agriculture, should prove especially valuable. It was prepared by the bureau of markets and crop estimates.

In the case of hogs, for example, actual average prices are given for each of the last 11 years, month by month, for several of the more important market centers. Tables show the average monthly prices for the 11 years combined. The man who ships hogs to Chicago can find out from a table in this bulletin that the average December price is 9 per cent lower than the 11 year average. The average September price is 8 per cent above the 11 year average. When comparing September, the highest month, with December, the lowest month, it is seen that the September price for the 11 years is 19 per cent above the December price. With such information available one can often adjust his farm operations so as to get his stock ready for market during the months of average high prices. He may also see where it would be profitable to hold his crops for marketing in months of higher than average prices.

"Pioneer" Baby Chicks

We can now supply all kinds of baby chicks, baby turkeys and ducklings. We have served the public for sixteen years and are better fitted than ever to give you good strong profitable chicks. Safe delivery and full count of live chicks at destination Copyrighted guaranteed.

We also carry a complete stock of puppies, birds and cages, pullets, feeds and supplies. Pioneer Incubators and brooders, also fireless brooders always on hand. Send for Price List. Visitors Welcome.

When Writing Advertisers Please Mention Cultivator.

A Living From Hens

By Jean A. Koethen

CALIFORNIA poultry has had a good deal of advertising lately, not only on account of the remarkable increase in production in the last two years, but because of the prices "California whites" command in the New York market, and it is not strange that eastern folk, looking for a more salubrious climate combined with a reliable income should turn their eyes toward the California hen. The following letter from J. L. L. of Garrettsville, Ohio, is no doubt typical of many that are coming to farm publications and prominent poultrymen all along the coast:

"I have read your book and the Cultivator and have just finished making a scrap book from Cultivator clippings. I plan to return to California in June, 1922, and purchase a few acres for poultry if conditions are favorable for next year and the future. I was in the business in Petaluma in 1901, was successful and liked it very much; was in Los Angeles winter of 1920. Land is so high I think Central California is more favorable. As California has a large surplus of eggs at present and it must be very expensive to ship east and as eastern folks, seeing California can ship at a profit, are going into the business in all sections, will the time soon come when California poultrymen keeping 1,000 to 2,000 hens on six or eight acres can not make a good living income with good management and productive stock? What is the average per hen per year for the year just ended, and is California poultry keeping as profitable as in 1901?"

To put it briefly, as I understand the question, is a man in middle age justified in giving up his business in the East and coming to California with the expectation of making a good living income with a commercial flock?

Such a question is always hard to answer because of the personal element. Some California poultrymen are making a lot of money right now. Some, I am sure, are not. The average farmer (and the poultryman is a farmer) is not a get-rich-quick promoter. He has rarely had the profits he was entitled to. When prices began to fall a year ago prices of farm products fell first, all except poultry products, which remained fairly stable and saved the day in many states, as Professor Dryden has recently pointed out. According to Professor Dryden, prices of chickens are now 67 per cent above the five year prewar average, and prices of eggs 73 per cent above. The question is, Will poultry and eggs continue in this enviable position as compared with other farm products or will prices drop to a point where a good living is not possible for the little fellow, the man who does all his own work and must depend solely on market eggs for his income?

At the annual meeting of the Poultry Producers of Southern California on January 28 the question of expansion of the poultry industry was discussed by both Manager Stanley of the southern association and Manager Barber of the Poultry Producers of Central California. Production in California has increased 20 to 25 per cent the past year, and a similar increase is looked for in 1922. In Washington the industry is growing even more rapidly. So far the Pacific Coast organizations have been able to find a market for all surplus eggs, and a federation of the five organizations is being arranged, which will probably be in a position to extend our markets as well as to do away with overlapping and competition. "The main thing that has developed a market for Pacific Coast eggs in New York," said Manager Barber, "is standardization. If standards can be improved our market may be extended." It is for improvement in standards and extension of markets that all organizations are working, and if overproduction, with consequent lower prices, is to be prevented, it will be because poultrymen stand together shoulder to shoulder, forget their differences and cooperate to the fullest extent.

Conditions in and around Los Angeles, however, are different from those in other parts of the coast be-

cause of the very rapid increase in population. So great has this been that for a part of the year Los Angeles imports eggs as well as exports them. Consumption has actually increased faster than production, and 110,000 cases of eggs were shipped in last year. How long this condition will continue J. L. L. knows as well as I. It may end with this season, and it may go on indefinitely.

Hand in hand with increase in population goes the backlot hen. No one knows how many there are of her, but some have estimated her numbers as anywhere from one to two million. Every newcomer who left a farm back in Iowa or Missouri or Ohio is pretty sure to have his backlot flock in California. Some have blamed the backlot hen for slightly lowered prices in 1921 as compared with 1920 and 1919, which was the best year California poultrymen ever had.

How 1921 compares with 1901 I do not know. That it is better than 1910 I am quite sure. The fact that the industry is organizing and working to standardize its products and to stabilize prices as well as open new markets is wonderfully hopeful. Eggs and poultry are a necessity; the reason the producer does not always get living prices for his product is not so much overproduction or lack of demand as because somebody else gets his profits. With the farm bloc in Washington demanding fair play for the farmer and our producers' organizations working for more stabilized prices it looks as if producer and consumer must ultimately get closer together and the industry go on developing the next ten years as it has the past ten.

Now here is a little advice for J. L. L., which may as well be taken by Californians as by easterners: Don't put your eggs all into one basket; two are better and safer. Come to California, J. L. L., and buy just as much land as you have money to pay for, or perhaps a little bit more. Set it out to fruit, whatever fruit does best in the district you have chosen. Plant a patch of alfalfa and buy a cow. Build a 1,000 hen laying house and stock it with the best White Leghorns you can find. The manure from cow and chickens will keep your fruit growing, and the milk will keep your chicks growing. When oranges freeze and the walnut crop is poor you will still have eggs to keep the pot boiling. When the egg market fails your fruit keeps you going. Fruit and poultry together is the safest bet. A good many California people are planting their places on this system and there will be more next year.

The average production per hen per year is generally set at 150 eggs, though many flocks reach 175. The net income per hen varies considerably according to management. It would hardly be safe to expect an income of more than a dollar per hen, but experienced and careful managers sometimes double and even quadruple this amount. So much depends on the breeding of the hen and the character of the man behind her that generalizations are impossible.

Poultry Queries

Conducted by Jean A. Koethen

Shall We Sell?

Our 59 pullets, not yet a year old, are averaging a little over 41 eggs a day, which seems very good to us. Our problem is the comparative price of eggs and feed. Our last sack of feed cost 15 cents more than the one before, and eggs are five cents a dozen less. We are obliged to sell to the local stores; they ship to the wholesalers who in turn sell to Los Angeles retailers. We took in 12 dozen fresh eggs this week and received only 20 cents a dozen. At this rate our hens will not pay their feed bills. Shall we sell them or do you think the market will pick up soon?—Subscriber, Arroyo Grande.

This morning's paper chronicled a slight advance in the wholesale price of eggs. Whether this is a harbinger

of better prices nobody can say, but I doubt if there is hope of a permanent advance while eggs are going into storage. Packers, as you know, always push the price down as low as

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus *Bacterium Pullorum* transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: Last spring my first incubator chicks when but a few days old began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged. Finally, I sent 50c to the Walker Remedy Co., Dept. 593, Waterloo, Ia., for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We never lost a single chick after the first dose. We raised 700 thrifty, healthy chicks, where before we never raised more than 100 a year. I'd be glad indeed to have others know of this wonderful remedy. Ethel Rhoades, Shenandoah, Ia.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 593, Waterloo, Ia.

If You Are Going to Brood

anywhere from 200 to 1500 BABY CHICKS and would like to have a SYSTEM that will furnish all the WARM FRESH AIR required, no matter what the climatic conditions may be, write us for our

possible while they are storing eggs in the spring, and the producer has just as much power as the local association can wield—no more. Possibly it is because of an unusual number of withdrawals from the Poultry Producers the past year that the organization has not been able to stabilize prices. Possibly the poultry producer is getting his share of the slump which all farm products have suffered. At any rate your problem is the problem of the whole poultry industry in California just now. It would certainly be a pity to sacrifice those fine pullets. Why do you not cull out those that stop laying from any reason whatever the next two months and keep the rest, at least till prices reach their summer level? Every hen that goes broody or starts to molt, every hen whose comb looks wilted or whose pelvic bones are stiff and close together may be removed without much loss. Then you might try preserving as many eggs as you can in water glass. Mix a quart of water glass with ten quarts of boiled water which has partly cooled, keep in a large stone jar and immerse every clean egg as soon as it is laid. These water glass eggs usually command a good price in the fall.

Chickenpox

My hens have a disease similar in some respects to roup. One eye is closed with hard pus in the side of it, and there are hard black sores on the wattles. I am giving Roupene and painting sores with iodine.—Subscriber, Morgan Hill.

You have probably discovered by this time that your hens have chickenpox. You should isolate all that show any signs of the disease, anoint the sores with carbolated vaseline and mix dry sulphur in the mash, one pound of sulphur to 50 pounds mash. If your flock is large and the disease seems to be quite general it may be best to write Poultry Division, College of Agriculture, Berkeley, California, about vaccination. This is rather

Holly Poultry Ranch

Hatching Capacity 200,000 Eggs

White Leghorn Chicks Only

Our customers contest which closed September 30, 1921, showed Farm No. 11 with 600 pullets hatched February, 1920, laid 217.09 eggs each, all in one flock. Can you beat this record?

We supply you stock bred for over 10 years for heavy production, incubated in the finest hatchery with perfect ventilation. Chicks delivered in perfect condition by our two specially constructed and ventilated auto delivery cars; capacity, 15,000 chicks at one load; or packed for express shipment by an expert who had 15 years in the Express service. Can any other Hatchery or Breeder offer you such service and quality chicks?

Call and see our new AIR WASHER SYSTEM, nothing like it anywhere. Perfect ventilation.

We are exclusive hatchers for spring of 1922, for F. R. Richardson, George J. Richardson, Charles G. Weaver, L. G. Hack, G. A. Saylor, C. W. Phelps, and George L. Miller; being the product of 25,000 pullets bred for the breeding hens.

expensive and not always successful, and the poultry division does not advise resorting to it unless there is danger of an epidemic. A good many poultrymen are coming to feel that chickenpox is due to heavy feeding in the warmer weather of early spring rather than to contagion and is to be fought by lightening the ration and adding greens instead of by vaccination. There is a great deal we do not know yet about chickenpox.

Sick Ducklings

My ducklings, 19 days old, are beginning to drop off without any sign of sickness. Sometimes within five minutes two or three of the largest will drop dead. For the first ten days I fed steel cut oats, then changed to one part corn meal, one part heavy shorts and three parts bran and five per cent beef scrap and green barley.—Subscriber, Riverside.

The proportion of corn meal and beef scrap is too large for such young ducklings, but the main reason for these sudden deaths is lack of sand or grit, which ducklings must have. I judge, as water is not mentioned, that the ration has been fed dry, and that too is hard on ducklings. It is better to start them after the first three or four days when bread crumbs or rolled oats or dry coarse bran are given, on a mash consisting mainly of bran with a small amount of rolled oats and shorts added, making one-third of the whole cut green feed, with at least five per cent sand or chick grit added, and moistening the whole with cold water till it is crumbly. After they are well started on this mash gradually add a little beef scrap and corn meal till the proportion reaches at the end of a month about what you have been giving. Never omit sand or grit for the ducklings must have it to digest their food with.

Feather Eating

My Plymouth Rock and White Leghorn hens are pulling and eating one another's tail feathers. They have a balanced ration of mash, greens and grain and are in good condition and laying well. Is this feather pulling a disease?—Subscriber, Venado.

Feather eating is a vice, not a disease. Sometimes it is apparently due to lack of sufficient animal food, sometimes there seems to be no reason. Like a child's biting its nails, it is a habit, and one not easy to break. In the case of your hens, as you are giving the mash only an hour in the morning, lack of meat and lack of occupation may both be to blame. Try keeping the mash before them all day, and in addition give a meal of green cut bone once or twice a week, just what the birds will clean up in 15 minutes. Give them in the morning enough cut alfalfa so they will have something to pick at all the rest of the day. All hens whose skin is bloody should be isolated at once. When a flock once gets a taste of blood and learns where to find it they will keep picking at each other.

Uneven Shells

Why do my hens lay eggs with uneven shells? Some have thick ridges

and sometimes the same hens lay eggs with smooth shells. The flock is on free range and has grain morning and evening. Are these uneven eggs suitable for hatching?—Subscriber, Hullville.

Only such eggs should be incubated as are perfectly satisfactory in size, shape, texture and color, eggs that will command the highest market price. You may be right in thinking the same hens lay both smooth and rough shelled eggs, but it is generally believed that each hen always lays a certain shape of egg and that if you set smooth large eggs the pullets hatched will lay eggs like those they were hatched from. Perhaps your hens have not enough lime to make good, strong shells.

Distinguishing Sexes

Will you please tell me how to distinguish males from females of White Leghorn chicks. Can they be distinguished at five days old as some experts claim?—Subscriber, Arroyo Grande.

People who handle a great many chicks learn to distinguish sex very early, just how early I do not know. The males develop combs first but the females feather out earlier. I am quite sure a well sexed cockerel can be picked out at two weeks of age, and probably an expert can pick out most of the cockerels in a flock before two weeks. A husky youngster with a more noticeable comb than the average is quite sure to be a male, and those that stand up highest on their feet are generally males, but this rule is not infallible.

Weak Pullets

I have what promised to be a very fine flock of pullets, hatched January, 1921, but they have not proven good. They do not seem to be sick, but sit around and dwindle away, finally die in many cases. They have the very best of care and a balanced ration. Can you tell me what may be the cause, and how I can build them up?—Subscriber, La Mesa.

If that were my flock I should examine the house for mites the first thing. That done, I should make sure that the hens had an abundance of fresh air. Some months ago I visited a poultry plant where the hens were sitting on the roosts moping and nearly suffocating with the dust raised in the scratching litter, which was kept in the house by lack of any air current sufficient to carry it off. All the ventilation came through the wired in front. Is it possible that something of this sort ails your flock? If you are satisfied that ventilation and cleanliness are what they should be, you will have to conclude, I fear, that there is some inherent weakness in the birds, due to sickness when they were small or to weakness in the breeding stock. In that case the best thing is to get rid of every mopy hen. Kill them if they seem sick, and send to market if they are merely not laying. If they are losing weight you have reason to suspect tuberculosis, and for this there is no cure but absolute cleanliness and elimination of every affected bird. You know, of course, that lack of green feed has killed off many a flock.

NATIONAL EGG LAYING CONTEST

English Wyandottes won the cup for February. The 300 hens in the contest laid 5,217 eggs during February, or an average of 17.39 eggs per hen.

Number of eggs laid by different breeds for month and to date are: Wyandottes, 926, 3,211; miscellaneous varieties, 910, 3,055; Leghorns, 877, 3,031; Plymouth Rocks, 785, 3,030; Anconas, 863, 2,624; Rhode Island Reds, 856, 2,562.

Ten leading pens to date are: S. C. White Leghorns, England, 430; White Wyandottes, England, 422; S. C. White Leghorns, England, 398; White Wyandottes, Missouri, 396; R. C. R. I. Whites, Missouri, 392; S. C. White Leghorns, Washington, 388; Barred Rocks, New Jersey, 361; Barred Rocks, Missouri, 360; White Wyandottes, England, 358; Black Langshans, Missouri, 353.

LIVESTOCK

Los Angeles, March 21—Weighed and delivered on cars without food or water: Hogs (hard grain fed) 125 to 175 lbs., 10.50; 175 to 225 lbs., 11.00.

Cattle (on feed, good weight): Steers, good, 8.00; medium, 7.50; cows, good, 6.50; medium, 5.50; calves, 125 to 150 lbs., 7.00; 150 to 225 lbs., 8.00.

Sheep: Ewes, 5.00@7.00; lambs, 11.50@12.50.

HIDES, PELTS AND WOOL

Quotations furnished by California Hide Corporation for stock delivered to warehouse.

Green salted hides—No. 1 steers, 7 per lb.; No. 1 cows, 6 per lb.; No. 1 bulls, 5 per lb.; No. 2 hides, 1½ less per lb.; grubby hides, 1½ less per lb.; kosher hides, 1 less per lb.; glue hides, 1 per lb.; No. 1 horse hides, over 50 lbs., 1.75 each; No. 1 horse hides, 40 to 50 lbs., 1.25 each; No. 1 horse hides, 30 to 40 lbs., 75 each.

Green hides—No. 1 steers, 6 per lb.; No. 1 cows, 5 per lb.; No. 1 bulls, 4 per lb.; No. 2 hides, 1½ less per lb.; kosher hides, 1 less per lb.

Calfskins and kipskins—No. 1 calfskins, under 15 lbs., 10 per lb.; No. 2 calfskins, under 15 lbs., 8 per lb.; No. 1 kips, 15 to 30 lbs., 8½ per lb.; No. 2 kips, 15 to 30 lbs., 7 per lb.; kosher skins, 1 less per lb.; glues, 1 less per lb.; slunks, 20@40 each.

Dry flint hides—No. 1 hides, 16 lbs. and up, 10 per lb.; No. 1 kips, 6 to 16 lbs., 10 per lb.; No. 1 calfskins, under 6 lbs., 10 per lb.; No. 2 hides and slunks, 2 less per lb.; glue hides and skins, 2 per lb.

Pelts—Large, long wool, 75@130 each; medium, 25@175 each; short wool and shearings, 10@25 each.

Goat skins—No. 1 common, 10@30 each; No. 2, 5@10 each; badly damaged and small kids, worthless.

Tallow—Tanners, white and hard, 5½ per lb.; No. 1 4½ per lb.; No. 2, dark and greasy, 2@3½ per lb.

Wool—According to quality and condition, 10 per lb. and up.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, March 21, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Movement moderate, market steady. Lugs, 80@1.00. Stocktons: Burbanks, per cwt., best, 2.40@2.50; poorer, 2.00@2.25; ungraded, 1.40@1.75 per sack. Idahos: Russets, best, mostly 2.00@2.25; bakers, 3.25; Rurals, 1.75. Orecons: Burbanks, bakers, 3.00. New stock, Carlsbad, 10@15 per lb., according to quality. Sweet potatoes: Movement light, market weak.

Locals, No. 1, best, per lug, 55@75; poorer, 50; few best, 85 in small lots. Arkansas: Nancy Halls, 4½@5 per lb.; per bushel, 2.00@2.25.

Onions: Demand light, market firm. Stocktons: Per cwt., White Globes, best, mostly 8.75@9.00; browns, best, mostly 7.50@8.00; lugs, whites, best, 2.75@3.00; browns, 2.25@2.50.

Garlic: 7@8 lb.; poorer, 5@6.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, March 21, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Northern, large, fancy, 1.50@1.75; medium, 1.25@1.40; small, 45@1.00.

Asparagus: Local, 60 lb. Imperial Valley, 50@60. Delta, 35@50.

Bunched vegetables: Per doz. bunches: Turnips, 35@40; carrots and beets, 70@75; radishes, 20; parsley, 20; spinach, 35@40; mustard, 20@25.

Cabbage: Per field crate, mostly 2.25@2.50.

Caulliflower: Market weaker. Per field crate, mostly 2.50@2.75; poorer, low as 1.75@2.00.

Celery: Movement moderate, market steady. Wide range in quality and prices; quality, generally ordinary. Locals, best, 5.00@6.00; poorer, 3.00@4.00. San Diego, cold storage, 8.00@8.50; small sizes, 5.00@6.50.

Lettuce: Demand moderate, market steady. Locals: Quality poor; best mostly 2.25@2.50; poorer, 1.50@2.00; per field crate, according to quality. Imperial Valley, small to medium sizes, 3.75@4.25.

Parsnips: 1.25@1.40.

Onions: Green, 15@20 bunch.

Peas: Imperial Valley, 35. San Pedro, 35@40 per lb.

Peppers: Demand moderate, market steady. Mexicans, Chilis, 11@15 per lb.; Bells, fancy, mostly 20@25.

Rhubarb: Box, 1.50@1.75.

FRESH FRUIT

Strawberries: 9.00@12.00 per cr.

CITRUS FRUITS

Grapefruit: Market firm. Californias: Northern, packed box, 3.00@3.25; market pack, 2.75@3.00; small, 2.00@2.50.

Imperial Valley, 3.00@4.50, according to size and quality. Arizonas, 3.75@4.75; few 5.00 in small lots.

Lemons: Demand and movement moderate. Market firm. Locals: Loose boxes, best, 2.25@2.50; poorer, 1.50@2.00; special brands, fancy, 5.50@5.75; choice, 5.00@5.25.

Oranges: Demand moderate, market steady. Navels, special brands, 176s and larger, 6.00@6.25; market pack, 4.00@6.00; culls, 50@1.00 per field box; few best, 1.50@1.75.

Tangerines: Demand and movement light, market weak. Best, 7@8; poorer, 5@6.

GRAIN

Prices on L. A. Grain Exchange. Barley, March delivery, 1.46½; Milo, March delivery, 1.30.

HONEY

A bumper honey crop is looked for, although the season may be late on account of cold weather. It will probably be about June 1 before the new crop is ready to move in volume. Beekeepers are making provisions for a heavy flow of nectar. Some plant species in Southern California have been in bloom for several weeks. Bees are active and starting to build up. Supplies are light, but the demand is said to be very limited. The market is largely nominal, with few recent sales. Quotations f. o. b. California points, for eastern shipments, less than carloads for pooled carlots, follows: White orange blossom, 11; light amber sage, 8; extra light amber sage, 8½; light amber alfalfa, 6¾@7. Little demand is reported for beeswax, which is selling lively at 22 cash or 25 in trade.

ROOT STORAGE EXPERIMENTS

The agronomy division at Davis is carrying on some storage experiments with root crops. Feeding tests have shown that roots are highly desirable additions to rations for certain animals. Yields have been found satisfactory, also, the tonnage per acre of mangels in some cases running over 50 tons per acre. But roots long and stored in a pile soon deteriorate from mold and decay. In the East successful storage is accomplished by placing in a mound covered with earth or in an underground cellar, but the main consideration there is to keep the roots from freezing. The difficulty we have here in our mild winter climate is keeping the roots cold enough to prevent mold and decay.

A system of storage to be successful not only must keep the roots from deterioration from spoiling to any great extent but must be handy and convenient to the place of feeding. Simply leaving the roots in the ground during the winter where they were growing during the summer meets the first requirement, but during rainy weather it is impossible to harvest them each day for feeding. In the spring the roots send forth seed stalks for reproduction, a characteristic which is accompanied with rapid deterioration in feeding value due to increased woodiness of the roots and stalks.

The different methods being investigated include: Ridges of roots covered over with earth both with and without ventilation and with and without a fly-roof to protect the ridge from the heat of the sun. Mounds of roots covered with earth both with and without ventilation. Stratification of roots in sand and earth both in a moist and in a dry condition, and storage in bins in an underground ventilated cellar.

The most striking results so far have been in the comparison of the ventilated against the non-ventilated ridges. The sections of the ridges not ventilated collapsed a short time ago and on digging out the dirt it was found that the roots had practically all molded or rotted away. The temperature of the non-ventilated ridges has run between 75 and 90 degrees Fahrenheit, while those of the ventilated ones has been between 40 and 48 degrees Fahrenheit so far during the winter. The ventilated ridges have not been dug into but have shown no signs of collapsing.

Later in the spring the various mounds and ridges will be opened to note the condition of the roots and especially to note if there are any differences among the different classes of roots, sugar beets, mangels, swedes, and carrots, as to their resistance to mold, decay and deterioration.

BARLEY VERSUS CORN FOR FATTENING PIGS

Corn has long and justly, too, been considered the premier fattening grain for hogs, says N. K. Carnes of the animal husbandry division of the Minnesota college of agriculture. Corn is deficient in protein and ash, the growing and muscle building materials, but is rich in carbohydrates and fat. When it is supplemented by tankage, a food rich in protein and mineral matter, it becomes a superior feed for fattening hogs.

Barley can be grown in sections where corn will not mature, and in many instances has proven a profitable grain to feed, but as yet no individual or experiment station has been able to demonstrate that barley is fully equal to corn in a ration for fattening hogs. Barley is a carbonaceous feed, containing more protein and ash than corn, but where corn is supplemented with tankage, the increased protein advantage of the barley is overcome. Barley contains more fiber and is consequently less digestible and palatable than corn.

A feeding trial just completed at the university farm bears out the above statements. Two groups of 11 and 12 fall pigs, respectively, were self fed, free choice from May 25 to July 5. Group 1 was self fed shelled corn and tankage, and Group 2 ground barley and tankage, with the following results:

	Group 1	Group 2
Initial cost per 100 pounds at university farm.....	\$10.61	\$10.61
Initial cost per pig.....	13.22	13.23

Average initial weight per head (pounds).....	124.6	124.7
Average final weight per head (pounds).....	203.4	187.9
Average total gain per head (pounds).....	78.8	63.2
Average daily gain per head (pounds).....	1.87	1.50
Total feed consumed per head:		
Shelled corn (pounds).....	261.36	
Ground barley (pounds).....		256.70
Tankage (pounds).....	38.29	46.53
Feed consumed for 100 pounds gain:		
Shelled corn (pounds).....	331.59	
Ground Barley (pounds).....		406.17
Tankage (pounds).....	30.18	29.41
Total feed per 100 pounds gain (pounds).....	369.88	452.70
Total feed cost per head.....	\$2.81	\$3.05
Selling price So. St. Paul.....	9.50	9.50
Selling price Univ. farm.....	9.00	9.00
Ave. sell'g price per head.....	18.31	16.91
Return over feed per head.....	2.28	.63
Feed prices: Corn, 45 cents bu.; barley, 44 cents bu.; tankage, \$47.50 ton.		

The pigs fed ground barley and tankage made smaller gains than those fed ground corn and tankage, and required 18.3 per cent more feed for 100 pounds of gain. All pigs from both lots sold at the same price, but the corn and tankage group made \$1.65 more profit per head than the barley and tankage group.

NEW EQUIPMENT, GREATER EFFICIENCY

The Kroyer Motors Company, manufacturing the Wizard-Four-Pull tractor, has now completed the removal of its plant from Stockton to the yards of the Los Angeles Shipbuilding and Dry Dock Corporation at

Wizard Four-Pull Tractor Handling Road Machinery.

Los Angeles Harbor. The removal of parts for upward of 200 tractors and the installation of special machinery has been proceeding since the first of the year, and the actual construction and output of the first unit of this year's production of tractors is now under way at the new plant. The shipyard plant, in whose machine, metal and wood working shops the Wizard tractor is now being built, has a record of \$62,000,000 of steel ship and machinery construction in the past four and a half years. The revolutionary engineering principles upon which the Wizard has been designed and built were developed as the result of Mr. Kroyer's 30 years of practical tractor experience. The machine presents many striking and unique features. Its pull is upon all four wheels and each wheel is equipped with shoes set at such angles as to give a worm and gear effect in contact with the ground and to yield the maximum of traction. To overcome the greatest possible amount of up-keep expense, Mr. Kroyer has built the Wizard with a motor which has 35 per cent reserve power after yielding its normal pull, and has also built every part of the tractor itself proportionately strong. The Wizard has not a single grease cup, and its only working parts exposed to dust and dirt are its wheels and its fan.

FRESNO CLAIMS HEAVIEST SNOW FALL IN UNITED STATES

Fresno County will be well in the running this year in claiming the heaviest snowfall of any district in the United States, if the weather man maintains his present mood.

The popular impression still goes in 47 states of the Union that Fresno is a warm place, but there is at least one section of the county that isn't just now. This is up in the Sierra Nevada, where Fresno County comes on to the rim of the world.

It is many a year since even the Sierra knew such a heavy precipitation. Trappers coming back from the trails and lumbermen working high up in the mountain camps tell of everything being covered with a heavy white carpet from six to eight feet in depth.

The United States weather station at Camp Seven, which is at about 7,000 feet elevation and five or six miles east of Hume in the Kings River watershed, is keeping close tab on the precipitation. The weather man there registered on January 14 no less than 45½ inches of snow and ice on the ground. Higher over the ridges and in the high Sierra meadows the depth of snow deposits goes well over the four foot figure, while there are drifts as deep as ten to twelve feet, so hardy travelers say.

At the Summit weather station, in the Northern Sierra, a precipitation of 48 inches has already been recorded, and the Fresno station to the south is gradually overhauling it. The registrations of the two Sierra posts are probably higher than anything in the Rocky Mountains—which would give the Sierra Nevada Mountains the heaviest snowfall in the United States.

One of these days it will become a popular pilgrimage to Fresno County

Thousands of city, town and village gardens also include small fruits, asparagus, rhubarb and other permanent crops.

This bulletin gives brief instructions for the planting and care of the more important small fruits and perennial vegetables. More complete information may be found in the special bulletins of the department of agriculture and of the state agricultural colleges and experiment stations.

CALIFORNIA EGG LAYING CONTEST

The contesting hens laid for the ten days from March 1 to 11, 3878 eggs, or a percentage of 62.5, Alex Stewart's at the front with a production of 81 per cent. Following are the high pens for the ten days' Alex Stewart, 81 eggs; Boehm & Noel, 78; R. H. Young, 77; D. B. Walls, 77; E. D. Crewdson, 76; W. J. Neef, 76; L. A. Thornewill, 75; J. J. Shore, 75; D. C. Berry, 74; Geo. B. Ferris, 73; C. R. Russel, 73; A. E. Seifert, 73; Sunrise Poultry Farm, 72; Geo. Wood, 72; Sea Breeze Poultry Farm, 72; W. A. Ford, 72; Bolfin's Poultry Farm, 72; C. P. No Speeding

Rastus, a young negro hand, was showing one of his employer's guests around the farm. Presently they came to a tree with a hornet's nest hanging from it.

"Well, Rastus," said the guest, pointing to the nest, "I'll bet you're afraid to poke this stick in there."

"No sah, boss. I won't do dat. Ise not afeard of de hornets, but I don't want to git arrested fer speedin'."

Went Too Fast

Jack—Yes, I had a little balance in the bank, but I got engaged two months ago, and now—

Muriel—Ah, love makes the world go round.

Jack—Yes, but I didn't think it would go round so fast as to make me lose my balance.

Advice is like snow: the softer it falls, the longer it dwells upon and the deeper it sinks into the mind.—Coleridge.

Let it mother your chicks

BABY CHICKS are frail little fellows. They must be fed and "nursed" and watched. For each fluttering bit of chick life represents a chicken. Each represents a future profit. Hence the right start means everything—to the chicks and to you.

Do you know what causes more chick deaths than anything else? Indigestion! For the digestive organs of the baby chick are just as delicate, just as sensitive, as those of the human baby.

Because we feel that nothing is good enough for a baby chick that is not clean enough for a human baby, *cleanliness* is our first consideration in the manufacture of SPERRY BABY CHICK SCRATCH. Cleanliness means a healthy flock—and that means healthy profits. That's why we take care that only prime, clean grains go into this feed. During its entire process of manufacture, the same absolute cleanliness is observed as in manufacturing SPERRY Red Package Cereals for your table.

Years of experience has taught us how to mix a feed with the same food values that the mother hen would scratch for her baby chicks on the open range. That's why SPERRY BABY CHICK SCRATCH is properly granulated and proportioned for fast-growing little bodies. Made of prime, re-cleaned seeds and cracked grains with a small percentage of high grade bone and charcoal—SPERRY BABY CHICK SCRATCH is the best feed-and-health insurance any poultryman can buy for his chicks. It gives them the sturdy start they need!

Remember, too, that SPERRY BABY CHICK SCRATCH is *absolutely gritless*. This means you do not have to pay a fancy price for shell and grit. You, yourself, can supply these more economically.

In the new edition of our booklet, "Makes Hens Happy," you will find quite a bit of help on feeding chicks—and grown-ups, too! Your copy is waiting for you—and it's free. Simply mail the coupon now.

Sperry Baby Chick Mash: This feed meets the demand of many poultrymen for a mash made up of ground grains and high-protein nutrients. It makes for rapid growth without overtaxing the gizzard and digestive tract of the baby chick. It should be fed in conjunction with SPERRY BABY CHICK SCRATCH after the first week. Your dealer has it—in 50- and 100-pound yellow-striped bags.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

One of California's most charming foothill and mountain outlooks is given on the cover. The San Bernardino mountains are in the background, East Highlands mesas in the middle distance, while the foreground is filled with lusty young orange trees. This is one of literally thousands of California's scenic beauty spots. Are not we who are permitted to live in such surroundings the blessed of the earth?

The government printing office at Washington has done some most creditable work in getting out the complete Report of the National Agricultural Conference which was held in late January. There are something over 200 pages in the report, and it gives in full the addresses and reports of various committees together with full list of all the delegates attending. We are not certain, but it is probable that readers of the Cultivator may secure copies of this report by writing the representative of their district.

The California Almond Growers' Exchange is mailing some 20,000 checks to members to cover payments for

almonds in 1919-20 and 21. These checks took to the growers something over a quarter of a million dollars, making a total of \$6,000,000 for the crops of the three years. The reorganization, or rather, signing of the new five year contracts, is arousing enthusiasm among almond growers.

After the farmer has spent the day hunting down coyotes, mice, hawks, rabbits, sparrows, bobcats, mountain lions, thistles, flies, moles, mealybugs, gophers, sowbugs, army and cut worms, ants, more ants, cockroaches, bud moths, tuber moths, nematodes, wireworms, centipedes, rusts, mildews, blights, and then ends the day with an attack on Johnson and devil grass and then spends the evening discussing the weather, he assured he can turn in and sleep soundly.

Those who are anticipating securing loans from the War Finance Corporation must bear in mind that according

tion by the class and a pageant will be given in the university grounds." We want our youngsters to be graceful and have all the accomplishments possible but, seriously, "taxes is high."

MADDOX RESIGNS

Harry Maddox, chief of the division of markets, has tendered his resignation to take effect May 15. The state law which brought about the consolidation of various commissions and bureaus having to do with state encouragement of agriculture stipulated that the headquarters for the director of agriculture and all of the divisions of the department should be in Sacramento. The consolidation was never fully effected, at least the division of markets has continued its office in San Francisco. Mr. Maddox has felt that the work could better be directed from the San Francisco headquarters, but in order that the consolidation may be secured he has ten-

R. CRUSOE—AN ADVERTISER GOT RESULTS

One of the most persistent advertisers in the history of success was Robinson Crusoe. He knew what he wanted—a ship—so he put up an ad for one. He flung a shirt on a pole at the top of his island; that, in the language of the sea, was plain to every seafaring man. The circulation was small—there was no other medium—but Crusoe kept at it, despite the fact that he got no inquiries for a long time. He changed his copy as one garment after another was frayed out—and in the end got what he wanted. Suppose Crusoe had taken down that signal after a time and declared "Advertising doesn't pay." Where would he and his story be now?—From Cooperation, Detroit.

to the terms of the law creating the corporation no money can be advanced after July 1, 1922. Therefore any application for funds should be made at once or as soon as possible. The application should be made through the local banker. It is possible congress may extend this time but it can only be done through the action of congress. The corporation announces that 2,201 advances have been made to farmers. The total amount loaned through the loan agency at Los Angeles has been \$5,000,000. There are 33 such agencies in the United States.

The University of California has succeeded in separating the fat from the milk of the goat. Careful tests have shown that 34 per cent of cream was secured while the skimmed milk tested only .015 per cent fat. The cream was then churned in an ordinary hand churn and the university reports "It broke readily and produced a high grade of butter."

There is a movement over the Middlewest which it is claimed is "spreading like a prairie fire." In effect the movement aims to eradicate the one room school house. Good roads, school busses and public sentiment are combining to consolidate many districts into one. In Iowa 3,300 one room schools have been abandoned, in Indiana 4,000; North Dakota has taken over 25,000 children out of one room schools; Texas reports consolidations of 144 districts during the past year.

The University of California officially announces that a lady "who for two years directed the famous Marion Morgan Dancers has been engaged by U. C. to give four courses, etc." One of these courses, entitled Social Dancing, is designed primarily for those interested in the improvement of conditions influencing the social life of high school and college students. Good form and style on the dance floor will be taught and also combinations of steps and figures suitable for group dancing. "A festival of dance pantomime is to be chosen for produc-

tion by the class and a pageant will be given in the university grounds." We want our youngsters to be graceful and have all the accomplishments possible but, seriously, "taxes is high."

SALMI AND SALAMI

The Cultivator is rather proud of the service it is rendering through its household department. Presumably some of the mere man readers do not know that there is such a department, but there is, and it is exactly in the middle of the paper.

Recently one of the home makers who depend upon that department to give them help wrote to the Cultivator for directions for making salami, an Italian sausage. Another, perhaps with French inclination, wished to know regarding roast or stewed game and she asked as to salmi. The best information procurable was at once furnished and in addition help was asked of other readers of the department. Since then salmi and salami recipes have been pouring over the editorial desk, and our home makers have had opportunity to learn as to dishes with real French or Italian flavor.

Then another had the old song running through her head, "Bury Me Out (or Not) on the Lone Prairie." The household department ransacked one of the best libraries on the Pacific Coast but could not secure the words. We asked for help from the always helpful, and from people's memories and scrap books we received literally dozens of replies. With them came the reason why the poem had not been found because the real title of the song was "The Dying Cowboy."

Then such sordid affairs as burned lard and other perplexities have been brought to the household department and all, so far as possible, have been given help and comfort. Often these requests for information test our ingenuity but the passing of the problem to the readers results, as in the case of the French and Italian recipes, in real help from those who know. The fact is made plain that the Cultivator family is a real helpful bunch.

WE NEED STOCKYARDS

A Chicago dispatch states that: "Farmers living on hard roads within a hundred miles of Chicago are evading high freight rates by sending their livestock to the Chicago Union Stockyards in rubber tired vehicles. The practice is steadily growing with the development of the good roads movement and the auto truck industry." Further that: "The trucks are stopped at the main entrance to the yards, their contents counted, and yardage fees collected. Then they are driven direct to the sales pens of a commission man for unloading. The livestock commission houses have helped promote this form of marketing by taking as much pains with a few head as with a full carload."

California stockmen are not worrying over the type of truck to buy to carry their stock to the market for California has no stockyards. There are possibilities of California becoming one of the greatest livestock states in the Union. This will not be until marketing conditions change. Marketing conditions will not materially change until we can have stock yards.

SECURING FEDERAL FUNDS

The procedure in making application for a loan has been made conveniently simple. If a bank, banker, or trust company has made or contemplates making loans for agricultural or livestock purposes, that is, for any purpose connected with growing, harvesting, preparation for market and marketing, it may receive from the War Finance Corporation an advance of money upon the putting up of such paper or any other paper that they wish to submit which shall prove acceptable. Associations of growers holding produce in their possession for marketing may receive advances from the corporation upon a basis similar to that applied to banks.

The money loaned is for various periods, none longer than one year. The banking or loan concern making the application is allowed for its expenses and guaranty of the paper a margin of two per cent in excess of the rate of interest charged by the corporation at the time the loan is made.

Application forms may be obtained by banks and loan concerns from any federal reserve bank or branch bank, from the War Finance Corporation, Washington, D. C., or from the Los Angeles Agricultural Loan Agency of the War Finance Corporation, the headquarters of which are in the Pacific Electric Building in charge of DeWitt Knox, room 390, while applications to be made by cooperative marketing associations are to be obtained from War Finance Corporation direct.

REDUCING CORN ACREAGE

As a rule American farmers have been rather backward in entering into any agreement to reduce acreage of any one crop. It has been practiced to a limited extent in the South in the effort to get a living price for cotton. But with the great carryover of corn since the biggest-ever crop of last year the question will bob up "Shall corn acreage be reduced?" In discussing the question from a purely financial standpoint Prof. Boss ends a rather extended article with "To be sure the grasses and clovers can well be substituted for a part of the grain or corn crops, but these are feed crops and must be converted into cash through the medium of livestock. Livestock needs supplemental feeds and of these corn and oats are in greatest favor. Think this over before cutting down the corn crop."

California Cultivator

Vol. LVIII, No. 13

Los Angeles, April 1, 1922

One Dollar Yearly

IN comparison with most deciduous fruit orchards and with vineyards fig orchards are notably irregular in size, shape and condition of trees.

Weak trees alternate with vigorous trees; sunburned trees grow next to low branched healthy trees; large trees are found in close proximity to small stunted trees.

The reasons for this spotted condition are various. Probably the most common cause of irregular fig plantings lies in the variable condition of the nursery stock. Fig trees are universally propagated from cuttings taken from all sorts and conditions of trees. Some are short, some long; some from one year old wood; some from two year wood or older; some are from healthy wood; some from weak or sunburned wood. They cannot be expected to give uniform results or send out a uniformly vigorous set of roots. The root system of one year old fig trees is tender and can be easily injured by careless digging or handling. Due to scarcity of nursery stock, growers have been in the past practically compelled to plant trees as received. Many are planted with well branched and abundant root systems. Many, however, have had the roots torn off in digging and are nothing more than a stick with a straight top and no roots. Such trees cannot be expected to grow as rapidly or develop into as vigorous trees as those with good root system to begin with.

Another reason for variable conditions in the young orchards is the frost injury to the trees in severe winters. Young fig trees of all varieties are quite tender and should be protected by wrappings of cornstalks or other wrappings.

Watch Nursery Stock

Fig nursery stock is very susceptible to drying out and the poor condition of some orchards is undoubtedly due to improper handling of the young trees whether in the process of digging from the nursery or in handling

Planting Fig Trees

By I. J. Condit, California Peach and Fig Growers

them at the orchard. The roots are succulent and tender and should not be exposed for any greater length of time than is absolutely necessary. It is a wise precaution to puddle the roots in mud at the time of planting or to keep the trees in a barrel of water which can be hauled through the orchard at planting time.

Young fig trees are also very susceptible to gopher injury, as most growers have learned through bitter experiences. The succulent roots seem to attract gophers and constant vigilance must be used to prevent serious loss.

Whether one or two year old trees should be planted depends upon the variety, the condition and the handling of the tree. Since the Kadota develops so rapidly and usually bears some figs the second year in the orchard, one year trees of that variety are preferred.

As a general rule two year old Smyrna and Adriatic fig trees are preferable to the one year old since the wood is more matured, they are less likely to have been damaged by frost, and they will withstand hardships that one year old trees will not. One experienced grower states that the roots "that grow on the base of the fig cutting the first year are very tender and careless digging or handling after digging will break the bark at the point where it joins the cutting, rendering it worse than useless. When the trees have grown two years in the nursery this union becomes strong."

Spacing Trees

The subject of distances to plant fig trees is one open for discussion. On account of their low spreading growth, Kadotas can be planted more closely

than most other varieties. One experienced grower outlines two plans for spacing Kadota trees:

The first at distances of 20 by 20, the second 25 by 25. Subsequent removal of trees which are on the diagonal would leave them spaced at 28 by 28 and 26 by 36. Since Kadota fig trees come into bearing early, this close planting is advantageous and thinning out will not be necessary before several profitable crops are secured. The usual spacing of Calmyrna fig trees is 30 by 30. The distances for planting will naturally vary with the character of the soil and the vigor of the trees. Many of the older orchards have been planted entirely too close with the result that the figs sour for want of sufficient light and circulation of air.

Adriatic trees have naturally a more spreading habit of growth and will require more space than Calmyrnas. In some soils 30 feet may be sufficient for them, but in most soils 32 to 36 feet will provide none too much room when they come into full bearing. The problem of spacing the Mission fig trees is the most difficult of all since this variety grows to immense size in deep soils. Mission trees planted 40 by 40 in the Sacramento Valley seem to be too close. Even some 55 by 55 are crowding. It seems therefore that young Mission trees should be planted 20 to 25 feet apart with the intention of thinning out the trees whenever they begin to crowd. It may be possible to keep the trees in bounds by proper pruning, although it is doubtful whether such a practice can be continued indefinitely.

Time of Planting

Rooted fig trees may be planted at

any time while dormant if the soil is sandy. If on heavy soil it is better to wait until the middle of February or even until March. The trees are just as well off in the orchard planted in a sandy or sandy loam soil, well drained, as they would be in the trench where they have been heeled in. In heavy, poorly drained soils early planting is usually impossible and the young trees might be injured by standing water.

The planting of a fig tree differs very little from the planting of any deciduous fruit tree. Greater care, however, should be taken to avoid exposure of the roots to dry air or to sunshine. Since the trees are not propagated by budding, they may be planted somewhat deeper than budded trees, with good results. Previous to planting the roots should be trimmed with a pair of sharp shears and all mangled roots cut back to vigorous wood.

The necessity for the irrigation of newly planted trees depends upon the season and the condition of the soil. In most cases it is necessary to follow up the planting with a small stream of irrigation water or with a tank wagon from which three or four gallons of water can be taken to settle the soil around the roots. Postponement of irrigation for an expected rain is a dangerous practice and is very likely to result in a loss of trees. It is a wise precaution to whitewash the newly planted trees in order to avoid sunburn.

Planting Cuttings

In some cases a good stand of fig trees has been secured by planting large cuttings directly in the field. Two or three cuttings are set in a place and covered almost completely with soil. They are kept watered frequently during the season and also cultivated. Most growers, however, prefer to set the cuttings in nursery rows and grow them for one or two seasons in such rows before planting out. It is very difficult to properly care for cuttings when scattered over a large area.

A Timber Line Poultry Plant

By William M. Bristol

THE CONDITIONS which have made possible the unique venture I am going to tell of do not exist outside of Southern California and are at their best in our own beloved San Bernardino mountains. Because the development has taken place partly on my own foothill property, where the picturesque East Highlands mesa laps onto Mt. Harrison, I have watched it, first, with incredulity and skepticism and then with mingled interest and admiration, as it grew into a practical and profitable success.

Several years ago I purchased a half section of land from the Southern Pacific Railroad Company immediately adjoining on the uphill side my orange groves on the mesa mentioned. Only a small portion of the land is tillable, the remainder consisting of rather open canyons and intervening ridges, all facing in a general southerly direction. Unlike most of the southern exposure of the San Bernardino mountains this tract has a gentle slope, too steep for cultivation, but still having

There are dreamers and dreamers, and the improbable, even impossible, dreams which have been worked out to a practical accomplishment and betterment of conditions for the human race continue to come and astonish us more and more each year. Here is one more such dream—or is today the first of April? In any case California is in a measure today accomplishing in the most practical way some of the things Mr. Bristol has dreamed. Hundreds of carloads of December eggs are being sent every year to the New York markets. The airplane may not enter into this commercial transaction very largely but the eggs are being produced and command the money. Who knows but the snowbanks of the peaks of Harrison, San Bernardino and San Geronimo may yet offer opportunity to so condition pullets that they will produce a still greater number of California December eggs.

a considerable covering of soil formed by the decomposition of the soft underlying bedrock and the sagebrush of the centuries. I have told in the horticultural journals of hauling out vast quantities of this virgin soil for fertilizing the orange groves below. It has required only a small portion of the tract, relatively, to supply the fertilizer demand, and the question of making profitable use of the remainder arose very soon after the property was acquired. There is more or less bunch grass and other forage in all these foothills, and this inevitably leads one to think of goats. But goats require either fences or herders; and furthermore, goat raising is a business

of itself, perhaps not beneath the dignity of the orange grower who is always in quest of fertilizer, but certainly encroaching too much on his pretty well occupied time and attention.

It is not strange, therefore, that when two years and a half ago William Styles, who had made a success of poultry at Petaluma and had sold out his plant there at a round profit, came looking for a place to re-enter the business in our warm southern foothills, some one advised him to see me. In view of the fact that I had already offered the use of an unlimited area, supplemented with some prerequisites for poultry raising, to

anyone who would give me the resulting fertilizer in return, it was natural that we soon got together on terms. There was no thought at the outset of the spectacular thing that has happened in connection with the venture—that came some time after when the unusual climatic conditions of the region impressed themselves upon the man from Petaluma.

I suppose everyone who has raised more than enough eggs for the home table has wished for some formula by which hens could be made to lay most of their eggs when eggs are highest in price. It is true that cold storage keeps them well enough for scrambling or cake making and that the water glass process answers very well for home use for some months. But when it comes to the delivery of the perfectly fresh article to exacting customers there is no substitute. Perhaps it was because Styles, an Englishman by birth, had come to California by way of Australia and had therefore had impressed upon him the fact that

(Continued on Page 354)

Agricultural News Notes of the Pacific Coast

Northern California

Sacramento holds its "Days of '49" celebration May 23-28.

Sheep shearing has started in Humboldt and Nevada Counties.

Sonoma County's tractor school will be held at Santa Rosa, April 24-29.

Six home evaporators were built last month by members of the Napa County farm bureau.

May 20 is selected for the annual farm bureau picnic in the Paradise section of Butte County.

Northwestern apples sold in California must conform to California standardization requirements.

H. S. Maddox has resigned as director of the state marketing division, his resignation to take effect June 1.

The United Chambers of Commerce of the Sacramento Valley has a membership of 23 chambers in the valley.

The present is the latest asparagus season in ten years according to Sales Manager Hoar of the California Vegetable Union.

Grape buyers are already talking contracts to the growers. Some contracts for Zinfandels reported at \$75; Muscats \$60 and \$65.

The Tehama County supervisors are planning to put the Red Bluff-Susanville highway in best of condition to carry the heavy summer travel.

A federation of poultry producers' marketing associations of the Coast is proposed. The plan is to establish sales agencies in eastern markets.

The Mt. George meat ring in Napa County won prize for best exhibit of ham, bacon and sausage in the contest at Davis during Stockmen's Week.

Much of the celery on the delta lands which was thought lost because of frost killing is growing out from the heart and gives promise of producing at least 200 carloads.

The cereal nursery work of the United States department of agriculture, formerly conducted at the plant introduction garden at Chico, has been transferred to the university farm at Davis.

The federal power commission has granted to the El Dorado Power Company license for the development of a 100,000 horsepower project on the south fork of the American River near Placerville.

The San Francisco chamber of commerce reports 263 new factories established there in 1921. It is estimated that the number of factory employes in San Francisco is more than 85,000.

The Northern California Counties Association with membership in Modoc, Lassen, Trinity, Siskiyou and Shasta Counties is devoting much of its energies to Lassen Volcanic National Park.

The Tehama County farm home department reports 90 demonstration meetings in February with an attendance of 910. At these meetings 116 dress forms and 24 arm forms were made. There were 13 demonstrations in use and care of the sewing machine and attachments.

A series of agricultural conventions will be held at Sacramento, May 29-June 2; County Horticultural Commissioners, May 29-30; Nurserymen, June 1; Federal Horticultural Board, May 31; Western Plant Quarantine Board, June 1-2; Western Directors of Departments of Agriculture, May 29-30.

Central California

There are now 1,100 acres being planted to alfalfa at Delhi.

Merced County last season shipped 725 carloads of sweet potatoes.

A tractor extension school will be held at Watsonville, April 10-15.

The Sun-Maid Growers will erect a \$500,000 packing house at Dinuba.

Kern County's fair will be held at Bakersfield the first week in October.

Tulare County creamery paid in cream checks during February \$168,156.67.

An experimental planting of peanuts will be made on the state settlement at Delhi.

Strathmore, Tulare County, shipped over the Southern Pacific last year 259 carloads of fruit.

Heavy plantings of sweet potatoes will be made in the Livingston section of Merced County.

C. H. Moore of Lindsay reports successfully keeping pomegranates in sand for the late trade.

Tentative requirements for state barley grades have been issued by the state bureau of standardization.

The eastern part of Stanislaus County had a snowfall March 10 which froze over the orange blossoms.

Tulare County, cooperating with the state highway commission, is maintaining inspection of trucks on highways to prevent overloading.

A state marketing organization for the olive growers is planned. The Fresno County chamber of commerce has voted \$500 to assist organization.

A sweet potato growers' organization was formed at Caruthers last week. It is planned to form a pool to market through the Turlock headquarters.

The first of the two bridges being built over the Kings River channel on the valley to coast highway near Lemoore will be thrown open to travel within a few days.

Fresno County is planning a peach growers' contest similar to that inaugurated in Sutter County. Units in the contest will be entire orchards in commercial production.

Demonstrations of evaporation of fruits and vegetables will be given in Fresno County from April 17 to 21 and 24 to 26 by Miss Lillian D. Clark, assistant state home demonstration agent.

Final payments for the 1921 crop of Navels have been made to growers shipping through the Terra Bella and Grand View Heights Citrus Associations of Tulare County. Average price per packed box, \$3.00.

The farm home department of the Kings County farm bureau shows registration of 279. The nutrition project will be taken up during May, June and July. The school lunch work along with the weighing and measuring of the children is being carried on in three schools.

Over 14,000 sack of beans are being prepared by the Modesto Bean and Grain company for shipment from San Francisco early in March to Russia. This is one of the largest individual orders received since the war and will clean up all the old bean crops in California. The shipment is made up of teparies, damaged old crop beans and recleaned screenings.

Southern California

Beekeepers are preparing for an unusually heavy honey flow.

Express shipments of asparagus are going forward daily from Brawley.

Escondido is making plans for its Grape Day celebration, September 9.

Escondido, San Diego County, has had a seasonal rainfall of 29.05 inches.

Graders are at work on the state highway between Banning and Indio.

The Riverside district shipped over 2,000 cars of citrus fruit by the end of March.

Date growers of the Coachella Valley are considering standardization of their fruit.

The orange products plant at San Dimas is handling 55 to 60 tons of fruit daily.

Imperial Valley towns are collecting funds for the county fair to be held November 23-28.

Pomona is protesting increase in water rates authorized by the state railroad commission.

Thousands of sheep are being brought into Riverside County from Utah for range feeding.

R. W. Schoonover, citrus expert for the university extension, will conduct survey of Riverside County.

The Deglet Noor Date Growers Association will build a fireproof packing house on its property at Indio.

The Southern California Purebred Stock Association will hold auction at Imperial County fair grounds April 18.

Frost protection of walnut and citrus groves will be discussed at the April 4 meeting of the Covina Men's Club.

The one week tractor school conducted by the agricultural extension service in Los Angeles County was attended by 69.

There will be a junior short course in agriculture at the Southern California fair at Riverside; also a junior judging contest.

Fillmore, Ventura County, held its second annual orange and avocado show March 11-18. Many high class exhibits were made.

A field day for peach growers of Riverside and San Bernardino Counties will be held early in April. Thinning methods will be studied.

Federal road funds will enable building of 1000 miles of new roads and improvement of 700 miles of existing roads in Southern California.

San Bernardino County beekeepers say that 2500 stands of bees have been shipped into the county from Idaho and Utah to take advantage of the spring flow.

Several steamers have been loading at Portland recently for Europe, carrying large blocks of dried prunes and some heavy shipments of fresh apples in refrigerated storage.

The need of a water conservation district for the Perris Valley is being urged by the local chamber of commerce. The plan is to conserve flood waters of the San Jacinto.

The report of the state division of viticulture on the grape growing possibilities of the San Fernando Valley is now ready for distribution. Copies may be secured at the office of the Los Angeles County farm adviser.

The Coast and General

Growers of some 4,000 acres of watermelons in Texas have formed a marketing organization.

Cotton growers of the Salt River Valley of Arizona have decided to stay by Pima as the only long staple raised in the valley.

The Willamette Valley Berry Association has closed its No. 1 pool for dried loganberries, on a basis of 27.17 cents a pound.

The Gillispie diversion dam of the Gila, about 55 miles southwest of Phoenix, Arizona, is now supplying water to 100,000 acres.

Manager Knox of the Arizona Cotton Growers' Association says the association will not only employ but handle its labor, regulating pay and housing.

Poultry producers of Linn County and of adjacent territory in Benton County, Oregon, have organized under the Pacific Cooperative Poultry Producers at Albany.

Maple sugar producers of New York have organized a cooperative marketing association. There are 500 members. A subsidiary organization will handle by-products.

Governor Morrison of North Carolina is calling "food and feed" community meetings over the state to encourage diversification—less cotton and tobacco planting.

Commercial auto buses and auto trucks operating over the highways of Arizona and Oregon will hereafter be required to come to a complete stop before crossing railroad tracks.

Plant quarantine conference at Washington, D. C., May 15. This meeting was postponed from April 19 because nurserymen could not leave their business at that busy time.

Northwest fruit growers realize the necessity of forestalling heavy losses on fruit received on markets in poor condition. To correct this effort is being made to institute inspection at shipping point.

A department of agriculture expert has been stationed at Roseburg, Oregon, to study problems of the Umpqua broccoli growers who find sales slowed up in the East by browning of outer leaves of their crop.

Manager Ward of the Pacific Cooperative Wool Growers has mailed checks for first payments on wool pools. The association sold for 31 cents a pound for three-eighths comb fine 24.15, medium 22½, coarse 21½.

Senator Claypool of Arizona has asked the Arizona delegation in congress to take steps to secure a strip of land along the northwestern boundary of the state of Sonora to give the United States access to the northern end of the Gulf of California.

The Wasco County plant of the Oregon Growers' Cooperative Association which was wrecked under the weight of snow during the height of the winter's storm, will be reconstructed with greatly increased floor space and the addition of a cold storage plant.

The Skookum Packers Association of Northwestern apple growers has withdrawn from the Northwestern Fruit Exchange because it has come under the control of the American Fruit Growers Inc. Former officers of the old exchange have incorporated the North American Fruit Exchange of the Pacific Coast.

April in the Vegetable Garden

Southern California

By D. F. Reichard

AFTER a winter full of weather, we are now hopeful and have good reasons to believe that our spring garden operations may proceed uninterrupted except for a timely shower once in a while to freshen things up a bit. This is usually counted on as being our third planting month in Southern California but for many this year it will be the first month of real activity. Things that have been planted during the past two months have made very little progress on account of our abundance of "weather," so that stuff planted now will be ready for use almost as soon as that put in a month or six weeks ago.

Having had plantings delayed so there has been ample time to get the ground in shape by deep working and thorough pulverizing, our seedbeds should be in fine shape. This means a great deal toward the success of one's garden. If the ground is in a fine moist condition cover seed only four times their diameter but if soil is a little cloddy and drier on the surface it will be necessary to plant a little deeper so that the seeds are in contact with damp soil all the time.

During April all manner of stuff may be planted with the possible exception of main crop and late peas, as only the early quick maturing varieties will come to maturity before the hot dry weather stops their growth. Put in sweet corn, bush and pole string beans; Lima beans, cucumbers; muskmelons and watermelons; potatoes, summer and winter squash. Besides these tender things put in such of the hardy vegetables as one cares for during the summer months. Set plants of tomatoes, sweet potatoes, eggplant, pepper, celery, cauliflower and cabbage.

If rains are not forthcoming it will be necessary to irrigate—do not allow the young plants to want for moisture. After each irrigation be sure to work up the soil to keep a mulch and kill any young weeds that might be starting.

Northern California

By A. R. Gould

WE can safely sow and plant the more tender beans, corn, tomatoes, cucumbers, squash, etc., in a temperature which will encourage rapid growth. The man with the hoe will also get all the exercise he needs as the weeds will be making headway after the rains and need attention at once. The crops will also need cultivating very frequently, and you will be surprised how this will help the growth. Then the man with the fork and spade will find considerable to do, and all plots should be well dug and manured, and always keep in mind the fact that to plant in poor wornout soil is waste of time and money, and, as we have often said before, buy the best seed from the reliable seedsman whose reputation is at stake and whose life is given to producing and selling the best. There are several such advertisers in the Cultivator who have helped in the development of the state and their seed ranches extend over thousands of acres. These firms study the grower and it is important that you appreciate this by

using this high grade seed—it will save you time.

Peas

This crop has been greatly benefited by the heavy rains and yields are likely to be large. As usual, Hayward and San Leandro sections have large plantings and around Mayfield extended plantings have been made. It is from these localities that most of the early peas are secured. Aphis is just at this time likely to become troublesome and severe attacks will injure the peas. They may be sprayed with black leaf 40, which will hold them in check. The tall growing varieties must be given support by wire or stakes. Sowings for succession may be made of Little Marvel, Yorkshire Hero and Alderman and the edible podded pea Melting Sugar. You can hardly grow too many peas as it is possible to use them all for after they are dried they will keep for winter use.

Potatoes

These must now be planted and if they were started in boxes as we advised last month they should be selected and the large tubers cut so that each section has two or three eyes. Before planting dip in formaldehyde or a solution of "Qua Sul," a sulphur compound which will be a protection from fungus disease and also nematodes. No use to take any chances. The "sets" or seed tubers should be planted 12 inches apart in rows at least 20 inches apart.

Early varieties are Rose Improved and British Queen, and main crop varieties to plant at the end of this month are Burbank, American Wonder and White Rose.

Lettuce

If sown last month as advised will need thinning, and this should be done without delay or weak plants will result. Allow a space of at least six inches apart for proper development in the rows, and the strongest seedlings should be used if required for transplanting.

Onions

Thinning of the main crop varieties should have been completed ere this. All plots should be kept clean weeded between the rows and the soil well cultivated.

Turnips

Make another sowing of Early Snowball. This variety matures quickly and will repay for extra care. Thin out those previously sown to at least six inches apart and cultivate between the rows frequently.

Tomatoes

About the middle of the month it should be safe to plant out tomatoes on the plots previously prepared, and the preparation should certainly be done before planting as these plants respond to a little manure and finer fruit will be secured. The plants should be placed four feet apart each way if they are to be allowed to ramble at will on the ground. If the single stem system is to be adopted plant 18 inches apart and stakes should be given them for support. Secure strong plants of such varieties as Ponderosa, Stone, Bonny Best, Early Jewel and San Jose Canner.

Squash, Muskmelon and Watermelon

These may be sown three or four seeds to a mound, which should be previously prepared with a little ma-

nure. These mounds should be four feet apart each way and should be kept fairly moist until seeds germinate. The method of cultivation of squash and melons is practically the same. The varieties we advise planting are: Squash—Early White Bush Scallop, Boston Marrow, Hubbard and Perfect Gem. Good pumpkins are California Field and Morse's Marrow, a real giant among pumpkins. The Vegetable Marrow is well known in Europe and is getting popular here, both green and yellow varieties. For muskmelons grow Honey Dew, Persian and Rocky Ford, while Golden Beauty is the best casaba. Best watermelons are Georgia Rattlesnake, Kleckley's Sweet and Chilian.

Cucumbers

These are not difficult to grow. Follow the same cultural directions given for squash. The best varieties to grow are White Spine, Long Green and gherkin, the last named used for pickling. The Lemon is also a fine flavored variety and has become very popular of late years.

Corn

Sow towards the middle of the month, three seeds to each group, which should be three feet apart each way. Field corn may be grown under the same conditions as sweet corn. Good varieties of the last named are Golden Cream, Golden Bantam and Country Gentleman. Best field corn is Yellow Flint, Leaming and Golden Dent.

Eggplant and Peppers

Sow seeds of Improved New York and Black Beauty eggplant in boxes of sandy soil and place in a warm situation; also pimiento, Chinese Giant and red chili peppers.

Beans

The more tender varieties of these may be sown in rows 20 inches apart but not before the 15th of the month. The best dwarf varieties are Golden Wax, Stringless Green Pod, Refugee, Davis White Wax and Early Mohawk, which is best for early planting. Good pole varieties are Horticultural, Kentucky Wonder, Golden Cluster and Scarlet Runner.

Celery and Leeks

No garden should be without these as they are invaluable and will keep after maturity several months. They are grown in trenches which must be first prepared with manure dug in several inches deep at the bottom, and this work must be done at once. The trenches should be 20 inches deep and placed at least two feet apart. Seeds may be sown in boxes of Golden Self Blanching and White Plume celery, also American Flag and Musselburgh leeks. Keep these boxes in a warm situation and fairly moist.

Raspberries and Strawberries

Chief work for this month is cultivating to encourage steady growth. Be careful not to damage any young shoots showing through from the crowns of the raspberries while engaged on this work.

Southern Arizona

By M. E. Bemis

TOMATOES may be planted in the early part of April, for there should be little danger of frost from now on. These may be planted in the ground where they are to grow or the plants may be set out. Dwarf Cham-

pion is an old standby, although some new varieties are being grown successfully.

In April seed and plant variety begins to narrow down from the list which the gardener may specialize on in February and March. The Early White Spine cucumber seems to be best adapted to this section, and although it is a little late for cucumbers, the early part of April will do very nicely for a general crop. These plants should be set six feet apart. All varieties of summer squash do well here, but winter squash should be planted earlier. At this season of the year two desirable kinds of peppers for this district are the Mexican chili and the Giant bell, which may either be planted where they are to grow or set out. And considering that many gardeners prefer to plant in a permanent place rather than to transplant, these may be, like the tomatoes, planted where they are to grow. However, either peppers or tomatoes which are already in the beds prepared for transplanting will probably be slightly earlier than those planted in the ground. Those who prefer may put peppers out any time in April, 24 inches apart in the row, and the rows three feet from each other.

Watermelons and cantaloupes should be planted in March for a general crop. It is not too late for a succession of such popular varieties as the Tom Watson or Black Seeded Chilian, both being suitable for later planting. For cantaloupes to be planted late in the season the Netted Gem and Rocky Ford are best. As to pumpkins, the early part of the month is the best time for planting. The Chinese pie pumpkin has proved itself a good variety. There is not much advantage in planting smaller root crops at this season, with the exception of radishes (White Icicle being good for late planting) and onions to be pulled for green onions. Eggplant may also be put out now.

The good gardener who is looking ahead and making plans for the fall garden will begin to prepare the land now. Before the weeds get too much of a start at least a ton of stable manure should be plowed into the land which has been in lettuce, cabbage or other winter growing crops. This land should be occasionally irrigated and harrowed throughout the summer at least often enough to prevent growth of weeds. It has been found advantageous to grow a crop of cow peas to be turned under.

In order to keep a dust mulch on the surface of the ground to prevent the soil from baking irrigation of all growing garden crops has to be rather frequent from now on, and each irrigation for the best results should be followed by thorough cultivation. It has been found that frequent cultivations not only save irrigation but produce better plants.

PHILIPPINE AVOCADOS

The last issue of the Philippine Agricultural Review, an official government publication, says: "The avocado, a fruit of exceptional value from the American tropics, is gradually gaining prominence and small orchards are being planted as rapidly as plants are available from home grown and imported seeds, and the people are beginning to like this, one of the best gifts received from America."

ECONOMY

THRESHING TIME is payday on the farm. After your long season of hard work, nothing less than full payment is going to satisfy you. Whether your crop be grain, rice, peas, beans, peanuts or any other that requires threshing, you can collect full pay—the *whole crop*—by using a Case Thresher. That is their first and greatest economy.

In addition to threshing clean and saving the whole crop, a Case Thresher on your farm enables you to thresh at the right time to get your crops to market when prices are highest or hauling conditions are best. That, sometimes, is a very real economy.

Then there's power economy. The working parts of a Case Thresher are few, simple and well balanced, making for light weight, easy running and saving in power.

Next comes their durability. Most of the Case Steel-Built Threshers sold eighteen years ago are still in use. The machines we build today are even more durable.

Due to their simplicity and dependability, Case Threshers work from morning to night, requiring few adjustments and little attention. Their light weight and rugged strength make it easy to move them from one location to another. Their efficient work keeps teams and pitchers steadily busy. There are seven sizes—20x28, 22x36, 26x46, 28x50, 32x54, 36x58 and 40x62, and there is a Case Tractor to operate each size.

The Case dealer will tell you all about Case Threshers, Kerosene Tractors, Silo Fillers, Baling Presses, Road Machines, Grand Detour Plows, and Disk Harrows. See him, or address a post card to

Lime Pays!

Many years application of Ferti-lime by prominent and successful California growers proves it conclusively. In addition to 80-85% carbonate of lime it contains some elements of plant food derived from clarifying beet juices. Ferti-lime is the best and lowest priced on the market—\$3.50 per ton in quantities f. o. b. Huntington Beach.

311 California Street, San Francisco
(Sole Agents for the Pacific Coast and the Hawaiian Islands)

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

WHEN TO USE LIME

"A lime soil is a rich soil" is true, likewise true. It is also true that cold acid and granite soils may be made the most productive soils by the application of lime. Lime may be applied in the form of burnt, caustic or quick lime; water or air slaked lime, ground or powdered lime stone or marine shell deposits.

The University of California has issued Bulletin 111, "The Use of Lime and Gypsum in California Soils," by J. W. Nelson, from which we quote:

"Lime materials have the power of improving the crum structure of clay and making it more pervious to water and air. Therefore lime makes clay and clay adobe soils looser, tends to prevent packing and baking, makes plowing and cultivating easier, and, in general, makes the soil physically a healthful medium for plant growth.

"Lime materials tend to make 'sour' soils 'sweet.' Speaking more correctly they tend to change an acid soil condition to a less acid one. Acidity of soils is detrimental to the best growth of many agricultural crops.

"Lime materials are necessary for the growth of beneficial bacteria and other micro-organisms of the soil. Lime furnishes the element calcium, which is as essential to them as to the higher plants. It promotes a slightly alkaline condition, which is probably ideal for their development. By its physical effect lime produces favorable air and moisture conditions for bacteria, as described above.

"Lime materials promote the normal decay of organic matter in the soil through their effects on the agencies of decay described above. The normal decay of organic matter in soil prevents the accumulation of certain poisonous materials that are detrimental to plant growth.

"Lime will not neutralize the toxic effects of sodium carbonate or black alkali."

GRAPE CONTRACTS ALREADY BEING MADE

While the season is early there is much interest in the grape market and crop for 1922, with a number of the larger buyers talking contracts. This is according to information given out by G. Walter Reed, Los Angeles representative of the United Chambers of Commerce of the Sacramento Valley, who has been advised that some contracts for the oncoming season's Zinfandels call for \$75 per ton; Muscats from \$60 to \$65. No prices have been given on black varieties. Conditions in the Sacramento Valley are reported to be very favorable for a big grape yield this year, as there have been no late frosts so far to kill off the young and tender shoots.

CHANGES IN HORTICULTURAL COMMISSIONERS

Former Commissioner Chas. F. Collins, who has moved to Oakland, has been succeeded by Frank R. Brann, for a long time Mr. Collins' chief deputy. The place of Commissioner Fred G. Stokes of Lake County, deceased, has been temporarily filled by the appointment of his brother, Earl Morris. Orange County's commissioner for many years, has been succeeded by A. A. Brock, former commissioner for Ventura County. D. D. Sharp of Riverside has been succeeded by A. E. Bottel, for a long time with Commissioner Ryan of Los Angeles County. K. L. Wolf of San Fernando, former U. C. boy, is now on Commissioner Ryan's staff, specializing on nematodes.

VACUUM FUMIGATION

Vacuum fumigation has been perfected until it succeeds in killing the bug in the center of a bale of cotton and destroying another insect's life in the center of cured fruit. It also has succeeded in making safe the planting of trees, the roots of which are infested with nematodes or other insect pests. This not only experimentally, but, as in Ventura County, a commercial working installation has been made. D. B. Mackie of the state department of agriculture was in Ventura County last week supervising final installation of Ventura County vacuum fumigator of a size sufficient to take in bundles of nursery trees, so that regardless of condition of the stock they may be taken from the fumigator and planted in clean soil with perfect safety. Unfortunately

hydrocyanic acid gas has but little effect upon root knot or other fungous troubles but insect life has to yield to the gas when there is no air to dilute it.

APPLE MARKETING COMMITTEE AT WORK

The committee of 16 apple growers representing the principal apple districts of Southern California appointed as a result of a mass meeting of apple growers held in Yucaipa in February, met in Los Angeles, March 15 for the organization and outlining of a concrete plan for studying the apple marketing problem of Southern California. The name of the committee as finally determined on is the Apple and Pear Growers Committee of Sixteen of Southern California. An executive committee was selected to supervise the activities of the committee at large and of the various sub-committees appointed on by-products, publicity, storage, marketing, and market information.

DESERT WINDBREAKS

In February, 1921, a Cultivator representative visited the Coachella Valley and among other items of general interest published one on the value of the evergreen tamarisk, *Tamarix articulata* of the botanist. It is the most wonderful combination of ornament and utility yet tried in very hot dry sections also restricted in plant growth by cold snappy winter nights. It has been tried in the Antelope Valley with equally good results and seems to thrive in all soils, under all conditions, from the desert to the sea. It certainly is transforming trackless sandy wastes of drifting soil into attractive well behaved landscapes of greatly enlarged commercial activities and possibilities. As seen on the Narbonne, Postlethwaite and other ranches in Coachella Valley it presents a pleasant change of view from the sandy waste.

PRESERVING ADDRESSES

The Placer County farm bureau and horticultural commissioners unite in printing a series of addresses made before the Placer County fruit growers convention held last October. It is a very valuable publication and contains drawings to make clear some of the points of the speakers. It would prove invaluable to fruit growers.

JAPANESE PLUM POLLINATION

Early blooming varieties of Japanese plums are usually deficient pollen producers and therefore unreliable for cross pollination, according to A. H. Hendrickson, assistant professor pomology of the University of California agricultural experiment station. Later blooming varieties are satisfactory pollen producers and may be inter-planted safely. These facts have been brought out by a recent study of plum pollination conducted in Santa Clara County. Results for the season of 1921 indicate that Formosa and Gaviota are apparently intersterile. This is the first time that intersterility has been reported as existing between two plum varieties of the same species. There is apparently no intersterility existing between European plum varieties and all those which blossom at the same time cross pollinate effectively.

KEEP COMPOST PILE FLAT

"It is of the utmost importance," says The Flower Grower, "that the top of the pile be kept hollow or at least flat, so that rain will keep the material wet and prevent burning and loss of fertility. Don't let the pile get rounded on top under any circumstances, as it should absorb the rainfall and not shed it, and, therefore, the nearer level it is kept the better job of composting will result."

The proceedings of the 54th convention of the California Fruit Growers and Farmers, held at Los Angeles, October 24-26, 1921, published as the October Monthly Bulletin, have now been received from the printer and copies may be had upon application to the director, California Department of Agriculture, Sacramento, California.

LEE Puncture Proof Tires

From the Isolation Hospital, Milwaukee Board of Health, comes the following: "We have used Lee Puncture-proof tires for the past four years—used the first Puncture-proof Cords in Milwaukee. We have never been laid up on account of punctures and have always received exceptional mileage."

"EXCEPTIONAL mileage and no punctures." What a world of saving, in time, money and annoyance, Lee Puncture-proof Tires represent on the farm.

Equipped with Lee Puncture-proofs, your automotive equipment gives the maximum of non-stop service.

Nails, spikes, broken glass or metal have no menace for Lee Puncture-proof tires because into them are built three permanent layers of case-hardened steel discs that no metal can penetrate. Yet, Lee Puncture-proofs are as resilient—as easy riding—as ordinary pneumatics.

Because the Lee Puncture-proof is unlike any other tire, it is the only pneumatic carrying a cash-refund guarantee against puncture, in addition to the maker's standard guarantee covering Lee Regular Fabrics and Cords.

So, for your own protection—for safety and service and saving—let your next tires be Lee Puncture-proofs.

The Lee Line of Pneumatic Tires and Government Specification Grey Tubes is represented by responsible dealers, in every locality.

The Perfectly Good Engine

A GOOD engine is a time and labor saver for both man and woman. On the average farm, there are many tasks—small in name, but big in importance—that must be done every day in the year. Pumping water, sawing wood, turning the cream separator, the churn, and washing machine are "muscle" jobs on the average farm. It is back-breaking work that can be done for a few cents a day with an

INTERNATIONAL Kerosene Engine

These high grade engines, built in four convenient sizes, operate on kerosene (common coal oil) as fuel. The materials used in the manufacture, and the quality of workmanship employed, are of the highest grade obtainable. One-piece crankshaft, removable cylinder sleeve, built-in magneto (no batteries), and wide faced belt pulley—all these are regular equipment. You get more for your money in an International than you can get anywhere else. Don't let another year go by with the members of your family laboring over the life-shortening jobs that can and should be done with an engine.

WHEELER, REYNOLDS & STAUFFER
624 California Street San Francisco

April in the Ornamental Garden

Northern California

By A. R. Gould

HERE has been considerable interruption in the work of planting this season owing to the unusual weather. Some plants you will find, although severely hit by frost, will need close inspection before you dig up or destroy. Among these are heliotrope, plumbago, calceolaria, lantana, hypericum and eugenia.

Growth has been very slow. Seeds have been slow to germinate and the damp may have ruined many of them so that it will probably be necessary to re-sow. The work of putting in new lawns should now go forward rapidly before the very warm season. I would advise those who are really looking for a good lawn to use the best grade of seed and a fine mixture of grasses. Australian rye, although very hardy, is inclined to get rust. Kentucky blue and the fescues are excellent for lawns. See that all the weeds are up before sowing the seed as this will save considerable trouble and expense for weeding. Have the ground well dug and use a commercial fertilizer to rake in the surface, and if the lawn is being replanted use a little lime to sweeten the soil. After the seed is sown rake in well and apply a thin covering of sand.

Selecting Shrubs

This is not an easy task for those who are garden making as in the first place there are so many which are really beautiful that one gets the desire to select more than space will allow. However, there are several important points to consider and chief is, "Will it be suited to our location?" Then, "Does it require more water than we can spare?" Trees which may be used as single specimens are cedar, pine, picea, cryptomeria, sequoia, cypressus, araucaria, casuarina, camphor and magnolia. Garrya elliptica, the silk tassel shrub, is very beautiful and has not been so widely planted as it should be. It has drooping flowers often a foot long. Among the distinctive shrubs are cytisus andreana, flowers yellow and brown, and C. monosperma, with slender drooping white flowers. Carpenteria californica, or tree anemone, is a native with large white flowers with a yellow center. Chorizema has small orange colored pea shaped flowers and dark green foliage. The sweet smelling Daphne may also be secured in its variegated form. The berberis of which there are now quite a number, crataegus and coloneasters also make effective groups and you will not go far wrong in your choice of any of the above.

The Perennial Border

Work of subdividing the clumps of those subjects which have overgrown their quarters may still continue and also transplanting. Hardy asters, oriental poppy, German iris, geum, campanula, delphinium, phlox, gaillardia, pentstemon, peony and helianthus may all be planted now, and the borders generally rearranged.

Dahlias

Tubers of all the best varieties may be secured this month of the types you admire the most. Space forbids mention of the many varieties but a careful survey of the growers' lists will give some idea as to the colors, etc. Seed may be sown in boxes of single

and collarette types and the resulting plants will flower this season.

Gladiolus

Still time to plant these and there are some beautiful shades to select from.

For Summer Flowers

To secure these sow at once seeds of aster, stock, zinnia, cosmos, ageratum, nemesia, lunaria, phlox drummondii, lavatera, clarkia, larkspur, godetia, marigold, balsam, schizanthus, celosia and candytuft, all very free flowering annuals, and they will provide a constant display until late in the fall. Sow the seed in boxes of sandy soil or on a well prepared border.

The Rose Beds

Planting of these should be completed this month and the beds well mulched with manure. Secure the best varieties to add to your collection Hadley, Columbia, Hoosier Beauty, Los Angeles, S. K. Rindge, W. F. Dreer, Madame E. Herriot, Ophelia, Golden Emblem, Miss L. Armour and Mrs. Stevens are all worthy roses.

Southern California

By Ernest Branton

UP to time of writing we have had no summer or strong "growing weather." In 3 years' residence in Southern California the writer cannot recall a winter and spring having such a low total of heat units. We still are in February so far as real tropical vegetation is concerned. Of course hardy plants, especially those used in eastern states, will grow when proper time comes, regardless of California weather. Therefore, while much more advanced gardening work may not safely be done, we may still sow and plant in February and March. Beware the expected hot spell for will no doubt soon arrive.

Sowing seeds out of doors at this season invites close daily inspection subsequently, for hot weather is sure to come and Old Sol quickly dries the surface soil, and sprouted seeds of seedlings quickly perish from heat and drought. Among the hardiest seeds, those that resist hot spells well are: Alyssum, balsam, calendula, cockscomb, coreopsis, centaurea, candytuft, marigold, mignonette (shade), larkspur, nasturtium, poppies of all kinds, portulaca, snapdragon and zinnia. More care, or little shading, will benefit: Aster, pansy, petunia, pink, phlox, lobelia, foxglove, daisy, gaillardia, hollyhock, penstemon, scabiosa and verbenas. These seeds are generally sown in seed beds, to be later transplanted when two or three inches high, and are not sown where expected to grow permanently. It is good practice to lightly sprinkle the beds in early morning so soil may drink moisture before the sun begins to pull on the surface water supply.

Under the stimulus of warm weather, coupled with good water supply, plant life delayed in development by cool weather will fairly leap forward. The soil will likely be hot and moist and you may almost see plants grow. Therefore, when watering irrigate thoroughly, do not superficially sprinkle. If you wish to sprinkle and spray it is the best time of the year to get after garden insect pests. Aphids are likely to appear on a

plants subject to their visits, and they multiply amazingly. If you get to work exterminating while numbers are few, you win. Early use of tobacco dust is often sufficient. Watch rose bushes and sweet peas closely.

Some plants need cool soil and should be mulched if possible. Pansies are a marked example. Also keep the soil about pansies loose on the surface before mulching or if grown without mulch. Around amaryllis and other bulbs stir the soil more deeply. Many plants coming from seeds will need care; thin and throw away the weaker ones. If transplanting is done use only the strongest. Weaklings seldom become vigorous. When thinning do not forget thickly matted clumps of perennials. They produce much better in thinned spots. Dig out with garden trowel sections from the thickest and transplant elsewhere, filling the holes in clumps with very rich soil. Even the tropicals, such as cannas, elephant ears, etc., may be planted or divided now. Bananas handle better now than at any other season, and tropical tubers such as dahlias should be planted at once. It is as well to caution all who garden in April not to have many "don'ts." Dare to do almost anything and dare to do it now.

FROST INJURY TO YOUNG WALNUTS

In an effort at ascertaining the extent of injury occasioned by the November frost to the young walnut orchards of Los Angeles County, the agricultural extension service, assisted by the field department of the California Walnut Growers Association, has recently completed a survey of the walnut districts. In certain sections trees up to three years of age were found to be frosted back badly, many clear to the ground, and in practically all parts of the county considerable frost injury was found on young trees. In some districts the injury does not seem to be confined to any particular variety but, in the San Fernando Valley at least, the varieties coming out early in the spring and going dormant early in the fall were found to have practically escaped frost injury. In all districts trees which were excessively sappy and still carried a portion of the leaves were badly injured.

As in the case of citrus, growers are advised to delay pruning back the young trees until new growth has started with the one exception that where the trees are found on examination to be killed back to or below the graft union it is recommended that they be cut off and crown grafted immediately. Experience indicates that badly frosted walnut trees may usually be saved by permitting a vigorous sprout to grow and remaking the tree from this sprout. There are many orchards which in their life history have been frosted back to the ground at least once and some several times and still the orchards have been brought out successfully.

During April and May several field meetings will be conducted at which there will be demonstration of recommended methods for treating walnut trees. Dr. H. S. Fawcett of the citrus experiment station is expected to conduct the disease demonstrational work. The schedule for these meetings is: April 5, 10 a.m., El Monte, place of E. A. Hayes; 2 p.m., Whittier, place of Ralph McNeese; April 7, 10 a.m., West Covina, place of Robt. Feely, 2 p.m., Rivera, Tom Gooch's walnut grove.

FOURTEENTH UNIVERSITY FARM PICNIC

April 29 has been announced as the date of the 14th annual picnic day at the university farm, and the committees to handle the tremendous amount of work entailed in putting over an event which is second to the state fair only as an attraction for farmers, has

been appointed. This action on the part of the university authorities puts at rest the various rumors which have been afloat recently to the effect that the big event would be discontinued this year. It is the opinion of the university authorities, in fact, that this year, even more than any of the preceding years, sees a real need for a

better understanding by the farmers of the problems confronting the college of agriculture and by the college of agriculture of the problems confronting the farmers. Picnic day goes a long way toward promoting such an understanding so that every effort is being made this year to make the big annual event even more of a real farmers' day than ever.

Exide BATTERIES

Every Time You Telephone

When you telephone, the electric current that carries your voice over the wire is supplied by a storage battery. The Bell Telephone and most other telephone systems rely on Exide Batteries.

Huge Exides are used for reserve power in nearly all the central lighting stations of our great cities. Exides run locomotives used in the mines; they propel street vehicles and submarines; they operate railroad signals and drawbridges. In scores of ways Exide Batteries assist in America's commercial supremacy.

nation, a great majority of all the electric light and power plants are equipped with rugged Exide Batteries. And into every Exide is built the experience of the world's oldest and largest manufacturers of storage batteries for every purpose.

The Exide made for your automobile has earned the reputation of *the long-life battery*. It gives uninterrupted service for so long that you will find it an economy as well as a constant convenience.

Do not take a substitute for the Exide—there isn't any.

The Electric Storage Battery Company Philadelphia

Service Stations Everywhere
Branches in Seventeen Cities

The nearest Exide Service Station has a battery the right size for your car. If your present battery needs repairs, no matter what make it is, it will be repaired skilfully and reasonably. If not in your telephone book, please write us for address.

THE LONG-LIFE BATTERY FOR YOUR CAR

You ride on air when you ride on a SEIBEL AIR SPRING SEAT. You can scarcely believe you are driving a tractor, for all the vibration, jolting, bouncing and swaying are gone. It will protect you from a permanently injured spine and serious kidney trouble. You will feel 100% fresher at the end of the day.

(Continued from Page 347)

the northern and southern hemispheres do their producing at opposite seasons of the year that he hit upon the idea he has put into successful operation here.

Soon after Styles had established himself in my foothills, late in the fall of 1919, I visited him one day and found him busily engaged in clearing brush on the sunny slope of the canyon he had chosen for his headquarters. Using that characteristic Anglicism which the native of the mother country seldom drops, he said to me, "Do you know, I've an idea."

"Let's have it," I replied, seating myself on a convenient bank to rest after my long tramp.

"I'm tremendously impressed with the warmth of these slopes at this season of the year. Here it is almost the middle of December," he continued, "and yet it is as warm as April."

"It's almost always warm here except when it happens to be snowing on the mountains," I replied, somewhat vaguely and apologetically; for I was in doubt as to whether he was finding fault with our boasted climate or was leading up to a commendation thereof. "But go on with your idea," I said.

Briefly, his plan was to capitalize the warmth of the southern slope of which I feared he was preparing to complain. Said he, "If winter in these sunny canyons is like spring elsewhere, and if I can take my hens about the time they quit laying and begin to moult to a colder climate, make them think that winter has come, and bring them back here in October when eggs begin to climb in price I have solved the problem of making them lay when eggs are worth money. I couldn't transport eggs laid in Australia in November quickly enough to sell them here in your autumnal November as fresh. But," pointing to Mt. San Geronio, 12,000 feet high, on the eastern horizon, he said, "I can take my hens by airship to the north slope of that mountain in April and have them ready by September to come back here and lay."

I scanned the Englishman's face closely to see if he was jesting. Perhaps if I were not something of a dreamer myself I should have pointed westward toward Patton and suggested that the course of empire lay in that direction. But having, in my relatively brief life of three score years, seen the telephone and the phonograph and the wireless and the X-ray and the automobile and the U-boat all come true, I restrained myself with the remark that if he could make his airship scheme work out all right I had no objection at all. In fact, now that the plan has rounded out one full cycle successfully and 3500 healthy hens are just slowing down in their production after laying during the fall and winter as if it had been springtime, I am willing to confess that I myself put a few dollars into the venture—just to make it more interesting.

My readers will be interested, perhaps, in knowing something of the other end of the venture, the winter quarters on Mt. San Geronio. It was Style's good fortune to be able to purchase from the war department for a song a dirigible airship of medium capacity. He has made six trips to his Greyback station, which is just at timber line on the northern slope. Of course it is not genuine eastern winter there at the time his flock is quartered there—that is not necessary. The sequence of the seasons is preserved and hastened sufficiently to produce the desired results. It goes without saying that there is no wagon road to that elevation, and even if there were it would not be passable at the early date when the spring trip must be made. It was my good fortune to accompany him on a trip he made in July last and to spend a week at the "station." With the help of a son, he has built on a little flat commodious houses of stone and logs for himself and for the hens. To the suggestion that it was the life of an exile, both father and son agreed that the relatively short time spent there precluded any such feeling; and as for the hens, whose actions spoke loudly for themselves, Styles said they seemed to enjoy the whole thing and that the two changes in climate per year must be responsible in large measure for their health and the financial success so far at-

Spells Doom to Rats and Gophers

Amazing Virus Quickly Kills them A Safe to Use. Not a Poison.

Rats, Mice, Gophers, Prairie Dogs—fact, all Rodent pests, can now be wiped out, easily and quickly. Imperial Virus, a remarkable new discovery, will kill them—IT KILLS THEM ALL. Rats and other rodents do millions of dollars damage each year. They kill chickens, especially baby chicks; destroy hatches, damage grain, merchandise and growing crops; and are filthy disease and germ carriers.

This amazing discovery is a flu true Virus—deadly to rodents only. It is not a poison and is entirely harmless to humans, stock, poultry, pets, etc. Easily spread on bait and greed eaten by all of these pests. Immediately sets up a burning fever, which also infects others, and all die outside hunting air and water. Thus no odor or annoyance from dead rats and mice inside of buildings or walls.

Imperial Virus is put up in seal bottles and will keep indefinitely, thus insuring full strength and potency unused. Thousands of users and leading agricultural authorities testify that Imperial Rat Virus is the ideal, sanitary, economical method to overcome these pests.

YOU CAN GET YOURS FREE

The manufacturers of this remarkable, true Virus are making a special introductory offer of two regular, full sized (double strength) \$1.00 bottles of Imperial Virus for the price of one. One to rid your own place of the pests, and sell the other to a neighbor thus getting yours free. As this offer may not appear again, you should act at once or clip for future reference. Special inducements to represent the If more convenient, send no money just your name and address to Imperial Laboratories, Dept. 104, 2110 Grand Ave., Kansas City, Mo. Pay the postman \$1.00 and a few cents postage when the package containing two bottles arrives. You need not hesitate accepting this liberal offer, as Imperial Virus is guaranteed to do the work your entire satisfaction within three days, or your \$1.00 will be cheerfully refunded.

tained. He had no difficulty in leasing from the forest service the necessary land and is planning to enlarge his rustic cabin enough to accommodate his entire family and the occasional friends who are fortunate enough to be invited to make the trip.

MORE ABOUT HEGARI

Regarding hegari illustrated in a recent issue of the Cultivator, I would say that this has been tested at the experimental station and found to possess several objectionable features. First it grows so high that it is impossible to harvest it with heading machinery and is like feterita in that respect but is less valuable than feterita because of its later maturity under California conditions. Moreover it has a heavy stooling habit which results in much irregularity of height, which is also objectionable from a machine harvesting standpoint. Any variety which stools as much as milo or hegari is bound to be irregular in

growth because the late formed tillers (stools) produce heads at a low level. These late formed stools also produce later maturing heads, which is also objectionable from a machine harvesting standpoint and necessitates a much longer period of drying before threshing can be accomplished.

This variety planted May 14 at Davis and, irrigated on June 23 and July 18, was only 80 per cent ripe October 10, and the immature heads were those on the later developing lateral stools. Certain individual hegari plants appeared to possess more desirable characteristics than the others, these having been isolated for "plant to plat" planting during the coming season with a view to improving the variety in field characteristics.

In working with grain sorghums for a period of ten years at the university farm I have been impressed with the importance of developing types which lend themselves to machine harvesting. This I believe is the most important consideration in the development of this crop. The expense of hand picking heads has, in my judgment, been the principal obstacle in the way of extending the acreage of grain sorghums in California, and I believe that the introduction of dwarf uniform varieties which carry their

A & M
Selected Dwarf
Milo Maize

This strain has for several years been in great demand because of its tendency to stool—each stool producing 3 to 7 heavy heads of maize.

Just ask your neighbor who has planted it. He'll tell you that he never saw such maize. Everyone who plants it pronounces it the best strain for our climate and soils.

Field selected for years, the strain is the same today as in previous seasons. Tell your dealer only A & M Selected Dwarf Milo Maize will do.

C. B. Hutchison

Prof. Hutchison of Cornell University will have charge of college of agriculture activities and will be dean of the university farm school at Davis.

heads on a straight stem will go far toward making grain sorghums a more popular field crop in this state. The kafirs, as you know, have become enormously popular throughout the dry sections of the Middle West and I think that this has been in large measure due to the characteristic straight head growth which adapts them to rapid and cheap machine harvesting. If the kafirs had been adapted to California conditions it seems probable that the expansion of grain sorghum acreages in this state would have paralleled that of the Middle West, but unfortunately the kafirs react unfavorably to our cold nights and require so long to mature that they cannot be produced in this state. The variety "White Yolo" approaches more nearly the ideal type of grain sorghum than any which we have yet observed adapted to California conditions. It has undergone a gradual improvement through five years of selection at Davis, and this selection is still being continued and we hope to gradually improve this strain until it is even better than in its present form. We have been on the lookout for many years for a new type of grain sorghum to serve as foundation stock for the development of a variety especially adapted to our state, and as yet nothing has come to our attention which is superior to this dwarfed hybrid strain, which we have named "White Yolo."

By addressing The College of Agriculture, Tucson, Arizona, you may obtain a copy of Arizona Circular No. 33, "Hegari in Arizona."—Geo. W. Hendry, Assistant Professor of Agronomy, University of California.

Our apple trees they do not pay,
We realize it well.
But if we'd all pitch in and spray
We'd have good fruit to sell.

Twenty years of active duty *still shooting hard and straight*

CROWS, hawks, and other devastating pests never get away from this man.

For twenty years he has been using the same Stevens shotgun, and for twenty years his trusty old gun has continued to throw the same hard-hitting, even pattern.

Through the years, the endurance and accuracy of Stevens guns have remained unsurpassed. When you pay more than the price of a Stevens gun, you don't get more gun quality — you are paying for frills and ornaments.

It's easy to prove the accuracy of a Stevens

Here's the test for a full choke: on a piece of paper draw a circle 30 inches in diameter; measure off 40 yards and fire into it. Your Stevens will throw an even pattern of 70% of the pellets into that circle.

A Stevens modified choke will throw an even pattern of 50%. And a Stevens cylinder bore will throw an even pattern of 40%. Try it. Only a perfectly bored gun will meet this test.

Stevens manufactures a complete line of small bore rifles and shotguns of every description. Ask at your dealer's or write for the interesting catalog describing in detail the complete Stevens line. Address:

WESTERN CANADA Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying

are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

City Dump

Some time after purchase of our farm the city established near by a dumping ground and sets fire to the material periodically. The stench is unbearable, also we are infested with flies, rodents, cats and dogs, both living and dead. Is there any relief? —Subscriber, Bakersfield.

Unquestionably this dumping ground constitutes a nuisance and an injunction will certainly prevail. Another method would be to take the matter up with the supervisors and have an ordinance passed forbidding the maintenance of this nuisance. The same situation some time since caused considerable trouble in the vicinity of Los Angeles, and the latter method was adopted.

Old Water Right

I have land under an old riparian water right, which has been irrigated each year. Last year several other water users established a concrete diversion dam. Have they the right to take out any water? Can they interfere with my right to take out water? Can they run a ditch through my land? There is no organized system, company or district, but the arrangement is an entirely voluntary one among several water users. —Subscriber, Exeter.

Apparently your right to divert water from the stream has for a long time been actively used and the water applied to a beneficial use. Such being the case your rights can in no wise be invaded by others, especially such a voluntary organization. You are entitled to receive water to the amount, at the point, and for the use which you have heretofore received it and applied it to a beneficial use. The parties installing this dam could be enjoined from interfering with this use and could also be restrained from running water through ditch across your land, unless this right had in some way been acquired long before. In fact, it is probable that by reason of the change to the concrete diversion dam you could restrain them even from diverting water through a ditch which had been established for a brush dam, as the use would be different.

Depth of Lots

Five years ago I purchased four lots by number but was told that the lots had a frontage of 100 feet and were 150 feet deep. A surveyor employed by a party who has purchased property in the neighborhood now stakes out these lots as only 130 feet deep. Which is right? —Subscriber, Delano.

The true dimensions of the lots are set forth upon the map of the tract recorded in the office of the county recorder. The surveyor is merely a private individual and his statements in respect to the lots are of no more value than those of any other private individual. If, however, you find that the party who sold you the lots was in error as to the depth you might still have a right of action against him for the difference in the value.

Lots Not as Represented

Six months ago I bought lots described by number, block and tract, according to the map on record. I built, and now find that statements contained in the map which the agent showed me at the time of sale do not correspond with map on record. What redress have I? —Subscriber, Medlow Park.

You are entitled to bring action against the vendor of the property for the difference between the actual value of the property and its value as represented. In such action you may also recover for the depreciation in the value of any improvements which you may have placed upon the property, or you may rescind the contract and, in addition to the recovery of the consideration for the property which you paid, obtain judgment for any special damage you may have suffered.

Vacating Streets

A town was laid out in lots. Streets and alleys surrounded them. Some of the streets are retained but many have never been used and the residents have farmed right up to the division fences in the center of the streets. Is it risky to buy a farm under such conditions? —Subscriber, Ramona.

There are measures which may be taken in any town or city by the trustees to vacate public streets and alleys as laid down upon the dedicated map. In such case the property reverts to the owner of the land under which the easement for street purposes was originally granted. It is probably true that unless such proceedings are taken the streets will remain dedicated public streets. It certainly would be highly risky to purchase any farm enclosing such streets without a very thorough investigation of the title.

Willing Property

A widower with children marries but there is no issue of the second marriage. Is all property acquired during the second marriage community property? He dies leaving a will. Does a will distribute all property or only what is left after the widow's share is deducted? If that is the case what proportion is subject to distribution by will? —Subscriber, Los Angeles.

All property owned by the husband before marriage and that acquired afterwards by gift, bequest, devise or descent, with the rents, issues and profits thereof, is his separate property; all other property acquired after marriage by either husband or wife or both is community property. It will therefore, have to be determined in this case if the property acquired during the second marriage resulted from rents, issues or profits of the separate property. If so, it would remain separate property. On the death of the husband the community property is subject first to the payment of debts and expenses of administration, then one-half of the community property must be distributed to the widow. Over this portion the husband's will has no effect. The only property which the will can affect is separate property, and the other one-half of the community property.

Support of Wife and Daughter

Is a husband obliged to support his wife and daughter of 19 years of age? There is community property. The parties have separated. Is the husband obliged to divide this property at the request of the wife? —Subscriber, Arcadia.

The parental authority and corresponding liability for support of the child ceases upon the child attaining majority unless the child is unable to maintain itself by work. Insofar as the wife is concerned the husband may be required by order of court to furnish such support for the wife in the court's discretion may be deemed best. But unless there is decree of divorce the wife is not empowered to have the community property divided, much less is the husband required to divide the community property.

munity property without order of court.

Disposition of Homestead

A homestead is taken out after marriage. What share does the wife obtain in case of separation? If the husband should die in such case without leaving a will and without children what share of the homestead would the wife obtain?—Subscriber.

If the selection of the homestead was made by a married person from community property or from the separate property of the spouse making the selection, or joined therein, the land so selected on the death of either of the spouses vests in the survivor. This disposition of the property cannot be affected by will, and the fact of the presence or absence of children has nothing to do with it. But in the case of a mere separation without any decree the parties are left to their own arrangements as to possession of the homestead. In case of a divorce the court may in its decree determine to whom the homestead shall belong. Neither of the parties can convey the homestead or abandon it unless he joins with the other in the deed of conveyance.

Abuse of Child

I have placed my little boy with a party to keep for me. A man who lives in the house abuses the child quite roughly. Could he be punished for such action?—Subscriber, Meridian.

Generally speaking no other than the parents or person in whose custody the child is placed has any right to chastise a child, and it is probable that the party in this instance might be subject to prosecution for assault and battery.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Eastern Black Stock for Walnuts

Can you tell me if the Eastern Black is a good root stock for walnut trees? I set out 20 acres this year to walnuts and am following method that I thought would give me a good tree, but since planting I see you write so much about the Northern California Black walnut for seed. I staked off my land with five foot stakes and at each stake planted three to four Eastern Black walnuts and later in the season I will pull out what trees I do not want and leave just one at each stake. Now in case some of the nuts should sprout I have several young trees in nail kegs to plant in their places. In this way I have a tree that has its root system untouched and when it is about five years old I will have the top worked over. I want to know if the Eastern Black walnut is a good root tree. My trees are in a deep sandy loam. — Subscriber, Guadalupe.

The "California Walnut," issued by the California Walnut Growers' Association, says under the section of the book devoted to root stocks: "The Eastern Black (*Juglans nigra*) is little used since it produces a less vigorous tree than the California. Some nurserymen advocate use of the Royal Hybrid, the name commonly given to the cross between the Eastern Black and the California. This stock gives a strong growing tree supposedly resistant to excessive soil moisture and other unfavorable conditions." The same book also says: "The Northern California Black (*J. hindsii*) is the most favored. It produces a strong vigorous tree which will withstand adverse soil and moisture conditions to a profitable degree. This species is a native of Northern California and easily obtained." The plan which the

subscriber is following will result in a more or less spotted appearance of the orchard. That is, there are sure to be variations in stock and in scion and in rapidity of growth. This is true also with trees in the nursery row but in nursery row there is possibility of selecting and rejecting trees not uniform in habit. However, there are other advantages in planting in orchard form, especially that of economy, and in the extra time required which will permit selection of varieties in grafting which may be developed during the coming five years.

Time for Planting Cots

I am going to plant an apricot orchard. What month would be best? If there should be any hardpan how deep down would it have to be not to affect the trees? If I should need to blast it what way is the best or easiest?—Subscriber, Ripon.

Plant at once or if impossible to

secure trees planting may be made next season any time between the first of January and, say, the last of March. They are already started and as soon as out of the nursery and in orchard form the better. The most popular apricot in California is the Royal. However, in your section the Tilton, Blenheim and some others are proving satisfactory. The best time for blasting hardpan soil is in the fall. When ground is dry it breaks or shatters much more satisfactorily than when wet. Unless soil is at least four feet deep above hardpan the breaking up of the hardpan is best.

Duty of Tree Inspector

What is the duty of a fruit and tree inspector? Is it to look at outside of bundles of wrapped trees or is it to open them?—Subscriber, Eureka.

Horticultural commissioners and their inspectors have a serious problem in this matter of inspection. To

observe every technical point in our laws and regulations to the very letter of the law would require a force of inspectors vastly increased. Of course, the inspector should be satisfied and, if conscientious, will be as to the contents of a package. In the first place he informs himself as to the section from which the shipment has been made. He knows from information in his possession for many months the general conditions and the efforts of the inspector who works in the shipping community and at first glance forms an opinion as to infestation. If, for instance, a bundle of grape vines is coming from a phylloxera infested area, naturally the bundle will come apart and careful inspection be made. On the other hand, if none is known nor other serious pests of the vine, it would be foolish to jeopardize the best interest of the receiver by inspection of every vine

The Newest Goodrich Tire

Goodrich "55"

The Tire for Small Cars

30×3½ clincher fabric
\$10.90

ALSO MADE IN 30×3

This is the latest addition to the Goodrich list of tires. It completes the line. It enables your dealer to give you full service under the Goodrich name and trademark.

It is great news for every user of 30×3½ clincher fabric tires. It is an opportunity to secure Goodrich quality—an assurance of Goodrich standards of workmanship and materials—with the advantage of a price which speaks for itself.

\$10.90 will buy the Goodrich "55"—the new tire for the popular light cars. The splendid construction is made better yet by the thick anti-skid tread of scientific safety design, made of specially toughened rubber.

A Goodrich for \$10.90! That means great value. Your dealer is ready to supply you.

or bundle of vines. Likewise, our state maintains quarantine officials at harbors. A shipment from Honolulu is very liable to carry Mediterranean fruit flies in the fruit in the handbag of a passenger, hence, careful inspection is made. If the ship comes from a Mexican port where the orange maggot is known to exist, equally careful inspection is made of

the ship, passengers and their baggage. If, on the other hand, a vessel comes from New York or Liverpool without touching a tropical port, the force is saved for more important labor on other vessels which are perhaps waiting in quarantine. So inspection does not necessarily mean examining under a microscope or glass every item in the package or every root on every plant. However, more efficient inspection is the aim of the greater number of officials and as a result California possesses the finest inspection service in the world.

Artichokes should not be largely planted for commercial purposes in Southern California because of climatic insufficiencies, first of which is, no doubt, lack of humidity. The fruit buyer for one of the largest chains of retail stores took us into the warehouse and opened several boxes of artichokes from various points, one being from your own shipping station, Arroyo Grande. He showed us in what respects those from the Half Moon Bay section, near San Francisco, were superior to others. They contain more edible matter, are firmer, less fibrous, more tender, better flavored and more uniform in quality size and form. The buyer said he would strongly advise against local planting for the reasons given; the demand is good but the supply is equally good. He ascribed the inferiority of the southern "choke" to climate; said that Arroyo Grande was considered as good as any section of the south but the product never commands the prices obtained for the Half Moon Bay brands.

Spray for Lemon Trees

Please give spray for lemon trees. I have 400 trees seven years old and there is considerable black or brown scale on them. The fruit becomes dirty and the body and limbs of the trees very dark.—Subscriber, Oakland.

One of the best sprays for black and brown scale is the old time rosin, or sometimes called Martin, spray. This is composed of rosin, 20 pounds; caustic soda, six pounds; fish oil, two and a half pints; water, 100 gallons. However, it is so dependably made and sold in small drums or kegs ready to use that it will probably be more satisfactory to buy the commercial product. The best treatment for this pest is fumigation where available. Information as to mixing sprays and fumigating may be had from the California Cultivator of September 24, 1921.

Globe Artichokes

Is it advisable to plant 15 or 20 acres to artichokes for the Los Angeles market, here or elsewhere in Southern California? What is the present supply and demand? Are the plants grown commercially in Southern California?—Subscriber, Arroyo Grande.

Gopher Control

We have so many requests for information as to gopher control that we have written to W. C. Jacobsen, superintendent of rodent control, asking especially as to the use of smoke or noxious gases. Mr. Jacobsen writes:

"In regard to suffocating and controlling gophers and other underground pests with a blower which carries poison gas into the burrows will say that as far as poison gases are concerned they are only about 50 to 60 per cent effective for gophers owing to the fact that gophers have a decided habit of blocking their tunnels against anything in the way of a noxious gas, oncoming water, or natural enemies. The pocket gopher may be said to be very businesslike in his makeup in that at the first sign of danger his means of defense, namely, blocking up his burrows, is resorted to almost immediately. Unless gopher tunnels are comparatively short and confined to rather moist ground there is danger that gases pumped into or blown into the tunnels will leak out into some of the unseen openings which come close to the surface of the ground and which are constructed by the pocket gopher while feeding. As far as squirrels are concerned, suffocating gases are very satisfactory, carbon bisulphide and chlorine gases perhaps being the most effective. Compounds containing sulphur, gasoline or distillate generally are not so effective as the two previously mentioned. I do not want you to gather from this letter that gases are altogether ineffective against pocket gophers, but certainly no gas method should be recommended over poisoning and trapping until some better gas is evolved than we have at the present time."

Transplanting Grape Vines

Is it possible to transplant grapes during their dormant season?—Subscriber.

Yes, by all means plant grape vines only when they are dormant. Likewise, cuttings must be taken off at dormant season. They may be ten or 12 inches long and are usually calused by being tied in bundles and put in a trench with butts up, but covered with four or five inches of moist earth.

Old Bordeaux Mixture

I have a jug of Bordeaux mixture which has been in the jug for two years. Is it safe to use?—Subscriber, San Diego.

We question whether it would be of any value if one wishes to use it for spraying curl leaf or similar trouble.

Pruning Strawberries

Should strawberries be topped now?—Subscriber, San Diego.

The cutting of the runners on strawberry vines depends on whether one is growing for fruit or for new plants for additional planting. If for fruit keep runners reduced at all times.

Mineral Specimens

Where can one get mineral specimens assayed?—Subscriber, Watts.

Write State Bureau of Mining, Sacramento.

HARRIOTTE

When the day is dark and gloomy
And you're feeling rather blue,
It is like the sun of summer
When Harriotte passes through.
For she's always got a jest,
Or she's always got a smile,
To drive away the shadows
And make life worth while.

So the fellow that can win her
Will surely get a pearl,
For she's just a bit of sunshine
And a true-blue girl.

When the road is rough and rocky
And life meets you with a frown,
She will get you safely over
With her sunny eyes of brown.
You will muster up your courage
And you'll have another try,
For you can't resist her chatter
And the laughter in her eye.

If a man was worthy of her
He would have to be an earl,
For she's sure a bit of sunshine
And a true-blue girl. — D. Lamont Smith.

NAN'S OPPORTUNITY

By Elizabeth MacKinnon Schatz in
Lutheran Young Folks

NAN REYNOLDS belonged to that class in school life, fortunate or unfortunate, known as the girl without a chum. No group had yet drawn her into its midst though she was now entering her sophomore year.

Nan herself could not understand why she had not been drawn into the magic circle. The girls were kind to her, gave her offices in the Y. W. C. A. and literary society which she filled creditably—no doubt the reason she was continually chosen for said offices. She was a splendid student and all-around good athlete.

The girls did not hesitate to ask Nan's help in regard to their studies. Her busy sign on her door was constantly ignored. They thought she didn't care for the lighter side of college life, but they didn't know the heartache which she bravely hid when spreads were talked of in which she was not included, when parties were planned and she was practically the only girl in her class not consulted, nor did they note the wistful smile which followed them when they passed her out walking in groups and issued no invitation to join them.

Nan was simply not in the inner circle—the social circle of college life which keeps the studious girl from getting narrow, for it is in this circle that the girls rub elbows and learn to live together.

Nan thought of all these things one evening as she sat alone in her room. She wished she could do something about it. If only opportunity would knock at her door, hand her a pink scented envelope which would contain the longed for invitation to enter the magic circle. Even as she smiled at her fancy a subdued rap sounded upon the door.

"Someone for help with her lessons," murmured Nan resignedly as she rose slowly and proceeded toward the door.

Before she could reach it she heard steps retreating down the long hall. Nan opened the door hastily and discovered to her surprise a folded slip of paper on the floor. Not a pink scented note, but it might have held all the perfumes of Araby if one could judge by the look of delight which came over her face as she read the few words written upon it.

"You will sing first soprano in the Glee Club. Report at four o'clock tomorrow at my studio. (Signed) Miss Hilton, Voice Teacher."

Nan clasped the little note tightly to her. The one thing she loved to do most in the world and the thing for which she had had the least time and opportunity was now open to her. Truly opportunity had knocked and she was quite ready.

She had hardly hoped that she would be admitted to the glee club. So many good voices had been tested. Her mother, a singer in her youth, had taken great pains to develop Nan's one talent. Well, her mother's efforts had not been in vain. She would write immediately and tell her of the happiness which had come to her.

Folding up the note carefully, Nan wrote her letter. She did not note the passage of time until the light's warning wink reminded her that only ten minutes remained to prepare for

retiring. She arose hastily and made her bed. Then slipping on her bathrobe and slippers she hurried to the bathroom. As she neared the open door the sound of her name spoken in an unfriendly tone arrested her footsteps.

"She's given Nan Reynolds a first soprano part and left Pearl Myers out. That spoils our bunch entirely." The voice belonged to Eunice Caldwell, a girl whom Nan very much admired.

"We'll see if Miss Hilton won't change her," observed another voice.

Nan waited to hear no more. She retreated to her room quickly, positive that the girls had not heard her felt slippers upon the hall floor. Her little castle of dreams lay in ruins at her feet. She saw that this golden opportunity to enter the glee club, instead of bringing her into a closer relationship with the girls, would only estrange them the more. Should she refuse the coveted place?

Nan could not help but notice a coolness in the manner of the girls toward her on the following day. She had braced herself to meet it and tried to be as cordial as usual. She found it hard to meet them on the same ground when she knew the thoughts which were passing through their minds. She wondered uneasily if they would have enough influence with Miss Hilton to put her out of the club.

As she drew near the studio Monday afternoon for the first practice she heard Eunice Caldwell's voice talking earnestly to the voice teacher.

"Please, Miss Hilton, don't break up our bunch of girls. Pearl has as good a voice as Nan. Nan is the only outsider in the glee club," pleaded Eunice.

Nan's heart seemed to stand still as she waited breathlessly for Miss Hilton's reply.

"Pearl's voice is not nearly as good as Nan's. If Nan could afford to take lessons she would make a splendid soloist for the club. I cannot put Nan out just because you girls wish to keep your clique intact." Miss Hilton's voice was firm and a trifle impatient.

"Well, our fun will all be spoiled if she goes on our tours with us," sighed Eunice.

"Why will it?" demanded Miss Hilton. "There isn't a nicer, brighter girl in the whole school than Nan. Why don't the girls take her in?"

"She hasn't any spunk. She lets the girls walk all over her. She's too anxious to be liked and shows it," explained Eunice.

Nan had heard quite enough. She almost stamped on the hall floor to make them hear her approach. Their voices died away. Nan's color was high and her eyes were bright as she neared the studio door. She knew now that nothing would make her give up her rightful place in the glee club. At first she had thought that it might make them like her better if she gave up her place to Pearl Myers. How foolish she had been to think of such a thing! Why, judging from Eunice's remarks, the girls would hold her in still greater contempt. Spineless, they would call her. This once they would see that she couldn't be walked over as Eunice had just expressed it.

Her heightened color as she entered the studio revealed the fact that she had heard the conversation. Eunice looked decidedly uncomfortable. Miss Hilton refrained from making any comment when Nan remarked quietly, "I couldn't help hearing what was said. Your voices carried clear down the hall."

Nan's lips were trembling, but she quickly gained control of herself as other members of the glee club entered the room.

Though the girls were courteous to her, especially at practice, Nan felt like an alien. If she had only known that Eunice secretly admired her for not throwing up her place in the glee club it would have comforted her quite a little. She had half expected Nan to do so and had expressed this hope to the girls. But their expectations were shattered in this direction, for Nan went serenely on her way. A time would come, she felt, when she would prove to the girls that she was worthy to be taken into their magic circle.

Meanwhile a conscious change had come over Nan since the afternoon of

Wise Mrs. Jones How She Got the Farm Hands to Eat Her Left-over Bread

Here's another fine desert for hard-working men. Full of the raisin's energizing nutriment. Digestible because the raisin's pure fruit-sugar is in practically predigested form.

Raisin Bread Pudding

$\frac{3}{4}$ cup Sun-Maid Seeded Raisins, 2 eggs, $\frac{1}{2}$ teaspoon salt, butter size of an egg, $\frac{1}{2}$ cup sugar, cinnamon to taste, $\frac{1}{2}$ large loaf of stale bread, 2 bananas or apples.

Soak the stale bread over night in water. When time to make the pudding press as much water as possible from the bread so that the bread is about the same consistency as dough, then take a fork and get all lumps out. Do not leave the crust if it cannot be mashed to the same consistency as the bread. Add well beaten eggs, salt and stir. Add raisins mixed with the butter. Put into dish in layers, covering each layer with sliced banana, sugar and cinnamon. Bake in slow oven until brown. Serve with whipped cream.

All measurements for this recipe are level.

Blue Package (seeded) best for pie and bread.

MRS. JONES, a thrifty woman, once wasted much left-over bread, which annoyed her. She wondered how to save it.

One day she saw a recipe—"bread pudding with raisins."

"The raisins make it taste mighty good," said she.

Next day she tried it on the farm hands. They ate all the pudding—asked for more.

Now she serves it twice, and frequently three times a week—and has to bake bread especially for bread pudding.

Jones' farm is now known for "the food the farm hands get" and Jones never lacks good workers, even when help's scarce.

Thus two problems, and not unimportant either, were solved by Mrs. Jones.

Try it. See what you can do with raisins.

SUN-MAID RAISINS

Always ask for Sun-Maid Raisins, produced from California's choicest table grapes.

Tender, thin-skinned, juicy—the finest raisins grown.

Prepared and packaged in a great modern glass-walled plant in a famous California valley, they come to you immaculate, wholesome and always good.

Seeded, blue package (seeds removed), best for pie and bread; Seedless, red

package (grown without seeds), best for stewing; Clusters (on the stem), a delicious quick dessert.

Raisins are 30 per cent cheaper than formerly—see that you get plenty in your foods.

Your grocer has them. Ask for the Sun-Maid brand.

the first practice. A reserve had crept into her manner. The knowledge of the reason for the girls' lack of interest in her served to change her attitude toward them. They still held aloof, however, and Nan wondered if anything would ever happen to change their relations.

A musical contest between five girls' glee clubs from different colleges had been arranged by the heads of the voice departments. Miss Hilton worked hard and diligently with the girls and they in turn would have practiced morning, noon and night to win the medal which was to be presented to the glee club which gave the best rendition of a number selected by a committee. Hillsboro, Nan's college, had been chosen as the best location for the concert.

It was the first thing of its kind that had been given in that section of the country. No wonder the girls were on tip-toe with excitement. Nan forgot the girls' animosity and they in their turn were too interested in the success of their glee club's efforts to think of their petty selfishness.

Faye Moran, who carried the solo part of the selection, was constantly admonished by the girls to do her self proud—for a great deal depended upon the soloist.

Nan, in her spare moments, would practice the entire selection. Her voice was singularly beautiful. Miss Hilton realized this more and more as she heard her sing with the other girls. She felt in her heart that Faye's voice did not possess the quality that Nan's did. It was a rule, however, in Hillsboro College that only a girl from the music department could carry a solo part in their concerts. As far as the committee was concerned this was immaterial. Miss Hilton appreciated the value of the rule, but for this one affair she wished it could have been set aside.

The night of the contest an excited group of girls gathered in Miss Hilton's studio. Five studios belonging to the department of music were located at the rear of the big auditorium. On this night a college glee club occupied each room.

The girls looked like so many butterflies as they flitted about the studio, humming snatches of their song. Nan stood among them conspicuously, a white butterfly. She would be very noticeable in the front row among the many blues, greens, pinks and yellows, thought Miss Hilton. The girls also looked at her dress askance.

As if divining their thoughts, Nan whispered to the voice teacher, "I'll change places with Amy Wells tonight and go in the second row if you wish."

"Nan, you are sweet to think of it, but you shall not do anything of the kind," answered Miss Hilton, ashamed of her momentary wish.

"All ready, girls," she called.

The girls stopped chattering and fluttered toward the door, arranging themselves in the order of their parts. Two glee clubs had already finished their parts on the program. Hillsboro came third. After the five selections had been rendered, miscellaneous numbers were to be given by each glee club.

"Come and trip it as ye go," hummed Faye as she ran up the steps which led to the hallway near the auditorium.

The next moment she did trip and fall, twisting her ankle under her. The girls ran to her and helped her to her feet, but her face had grown very white and she could not walk.

"Nan, tell them to go on with the program while we see what can be done to adjust matters and help Faye," requested Miss Hilton with admirable calmness.

Nan nodded and slipped away. She briefly explained the circumstances to the waiting glee clubs, then hurried from the building to her room in the dormitory. Back she flew with bandages and liniment, which she presented to the grateful voice teacher.

"We have telephoned for the doctor, but these will help," said Miss Hilton as Nan knelt and deftly bound the injured ankle. Faye smiled at her wanly.

"You're a dear girl, Nan," she said huskily.

Nan smiled at her brightly, then turned quickly as she heard Miss Hilton say: "We will have to withdraw from the contest, I'm afraid."

A wail of protest came from the girls. "Oh, Miss Hilton, why?"

"Well, Faye is the only one who

has studied that solo. This shall never happen again. We shall always have a substitute in the future."

Nan came toward her swiftly. Her college was to be thrust in the background by this untimely accident. It was not to be thought of! Timidly she had shrunk before from thrusting herself forward, but now there was no hesitating—the honor of her glee club was at stake—for Nan well knew it was an enviable honor to be chosen for the medal which was to be awarded.

"Miss Hilton, I have practiced Faye's solo many times in my room and I know I could sing it if you will try me," she offered eagerly.

"That is fine, Nan, but you cannot take the part. It is against the rules. You are not in the department of music," said the voice teacher hopelessly.

Gloom settled over the girls. It was a shame after they had worked so hard and hoped so much to have to give up this chance at the last minute. Miss Calhoun, the president of the college, who had been informed of the accident, entered at this crisis.

"Well, Faye, this is too bad," she murmured to the injured girl. "I'll stay with her and you go next on the program," she added turning to the girls.

"We can't," cried Eunice, "unless you let Nan take Faye's place."

Then Miss Hilton explained the situation in as few words as possible. Time was flying and this question must be decided at once.

"Certainly, let Nan take her place if she can do it creditably. That is a good rule, but no rule is very good unless an exception can be made to it sometimes," announced the president decidedly.

Now that the question was settled, Nan experienced a nervous sensation. Suppose she should break down—the girls would never forgive her. She had offered her services and she must render full value.

As the girls filed in upon the brightly lighted stage, Miss Hilton felt glad that Nan's dress made her conspicuous. Nan, on her part, felt relieved that part of the chorus singing in the selection came first. It gave her time to get her bearings.

The glee club held its breath as the slender white gowned girl arose and stepped a little in front of the chorus. Nan's manner suddenly filled them with confidence. Then she sang. Her voice, bell like and clear, filled the big auditorium. People who had settled in their seats with bored expressions upon their faces roused themselves with interest. As the last notes died away she slipped into her place again. Miss Hilton's face glowed with pleasure.

The four other contestants filed in upon the stage. While the judges were out deciding upon whom to bestow the medal, college songs were sung. The Hillsboro College girls were surrounded by congratulating friends a few moments later when they were presented with the medal which they might have lost had it not been for Nan. A happy Nan was later surrounded on the stage by her own glee club.

"All ready, girls," cried Eunice, and the girls yelled with all their might: "Rah, rah rah—rah, rah, rah—rah, rah, rah—Nan, Nan, Nan!"

Nan had entered the magic circle at last.

HOUSEHOLD QUERIES

Peanut Brittle—French Bread

Please give me recipes for peanut brittle and for French bread.—Subscriber, Corona.

Peanut Brittle—2 cups sugar, 2 cups shelled peanuts. Melt sugar; when a golden brown add chopped nuts; pour into hot buttered pan, crease and cool.

French Bread—Pare and cut two medium sized potatoes and cook until very soft in three cups water. When cooked rub through sieve and cool. There must be two cups of this. When it is about 80 degrees Fahrenheit pour in mixing bowl and add 1 yeast cake crumbled in, $\frac{1}{2}$ ounce (1 tablespoon) shortening, 1 ounce (2 tablespoons) sugar, $\frac{3}{4}$ ounce (2 teaspoons) salt. Stir to thoroughly mix, then add 8 cups flour. Work to a smooth dough then knead 10 minutes. Place in well greased bowl, turning dough over to thoroughly coat. This prevents a crust from forming. Cover

bowl and set aside to rise for 3½ hours. Now lay over the dough by pulling in toward center, the sides and ends of the dough, until it forms a compact mass. Turn over the dough, cover and let rise for 1 hour. When ready for the pans cut or divide into 6 pieces and mold into loaves 3 inches thick and 12 inches long, rolling loaf on board, making pointed at ends. Place clean cloth in deep baking pan and sprinkle cloth with cornmeal. Place loaf of dough on cloth and sprinkle lightly with cornmeal. Now lift cloth up close to dough, making cloth partition between each two loaves. Let loaves rise about 45 minutes and when ready to bake lift dough carefully from cloth, lay on a baking sheet and gash slightly with sharp knife. Wash with egg and water and bake 45 minutes in hot oven, adding small saucepan of boiling water to provide steam to keep loaf moist while baking. One-half this quantity for small family.

Curing Pork

Please give method of curing pork so it will keep either as bacon or salt pork. Meat which we have cured has had the fault of getting too salty as it dried.—Subscriber, Sonoma County.

The saltiness of your pork can be greatly reduced by parboiling. For sugar curing we use 10 quarts salt, 3 teacups black pepper, 3 tablespoons cayenne pepper, 5 pounds cane sugar. Put in large pan and heat; stir while warming. When thoroughly warmed rub into meat. Use clean boxes or barrels and allow to remain packed for at least five or six weeks. Take up and dip in boiling water and then lay meat on table to dry. When thoroughly dry rub with powdered borax and black pepper, equal parts. If desired the pork may be smoked after this treatment. Fuller directions for handling all kinds of meat may be had in Farmers' Bulletin 1186, which you can get by writing Department of Agriculture, Washington, D. C.

Steam Pressure—Fireless Cooker

Can you tell me anything about steam pressure cookers? Are they complicated? Would they be hard for an older woman to learn to use? Are they expensive? Which is the best and easiest, a steam pressure or a fireless cooker, and what is the difference in price?—Subscriber.

We have never seen anyone who has used a steam pressure cooker who was not enthusiastic in its praise. They are not in the least complicated; anyone can easily handle them. As to expense it costs a little more to buy a pressure cooker than a fireless of the same cooking capacity. In one well known make of pressure cooker 12-quart size costs \$29; 25-quart, \$41; fireless, 12-quart, \$19.75; 20-quart, \$32. The great recommendation of the pressure cooker is saving of time—beans, for instance, cooking in 40 minutes, a ham in 50 minutes. The fireless saves fuel, heat and labor of watching. Both are invaluable to the busy housewife, and especially in the hot days of summer when canning time means weary flesh and bones unless one or both of these aids are at hand. Pressure canning makes easy preserving of meats and vegetables as well as fruit.

We have merely touched here a few outstanding points. Now we would like to hear from those who have tried either or both of the cookers as to their actual experience. Is a pressure cooker or a fireless cooker worth buying, and why? For answers received at this office by Saturday, April 8, we will be glad to give subscription credit to the California Cultivator for one year. Address Household Department, California Cultivator, 317 Central Avenue, Los Angeles, and with your letter send name and address of one to whom you wish subscription credited.

Corned Beef

Please give me directions for making corned beef.—Subscriber.

Cool carcass thoroughly and cut in pieces five or six inches square. The heavier cuts, such as plate, rump, cross ribs, brisket, are generally used. Corned beef is better than too lean. To each 100 pounds meat allow eight pounds salt. Sprinkle ¼-inch layer of salt in bottom of barrel. Pack meat as closely as possible, making five or six inches thick. Put on layer of fat, following with alternating layers

of meat and salt. Have thick layer of salt over top. Let stand over night, then add for each 100 pounds meat four pounds sugar, 2 ounces baking soda, 4 ounces saltpeter, dissolved in 1 gallon tepid water. Three gallons more cold water should be enough to cover this quantity. Put loose board over meat, weighting with heavy stone to keep under brine. If brine becomes slimy or ropy make new brine of 8 pounds salt, 4 pounds sugar, 2 ounces baking soda and 4 ounces saltpeter dissolved in 4 gallons water. Pour off old brine and wash meat thoroughly. Add new brine. If meat is kept a long time brine should be changed occasionally. The meat will usually be corned and ready for use in six weeks.—From Cruess' "Home and Farm Food Preservation."

HINTS FROM HOUSEKEEPERS

Candied Orange Peel

Save up the orange rinds for two or three days, keeping them in a cool place. When ready to use cut them in narrow strips with scissors and put on to cook in cold water to barely cover. Bring to boiling point, discard water, and then repeat the process. Do this three times, then measure the orange peel and add an equal quantity of sugar, together with water to cover, and simmer the whole gently until the peel is translucent. Drain, roll pieces in granulated sugar and let them stand exposed to the air for a few hours to dry. This may be used in fruit cake, as a garnish in a

plain cake with an orange filling, or a little may be lightly sprinkled over a sponge cake before it is baked. Can be kept a long time in glass jars.

Oatmeal Raisin Cookies

1 tablespoon Crisco, ¾ cup granulated sugar, 1 egg, 1 cup cooked oatmeal, 1½ cups flour, 1 teaspoon baking powder, ½ teaspoon cinnamon, pinch salt, 1 cup raisins cut in small pieces. Cream sugar and Crisco, add egg and oatmeal and beat well. Sift together flour, salt, cinnamon, baking powder. Add to first mixture, with raisins on top. Mix all together and drop from a teaspoon on greased pans three inches apart. Bake in moderate oven ten minutes. This makes 36 cakes and they are fine. We enjoy the Cultivator very much. Can hardly wait until it comes each week.—Subscriber, Alhambra.

Some Good Recipes for Every Day

Good Bread.—In the evening soak 1½ cakes Magic yeast in ½ cup warm water ½ to 1 hour. Add 3 to 4 teaspoons salt, 3½ cups warm water and 1½ to 2 quarts flour and make smooth sponge. Cover and set away till morning, then add 2 tablespoons sugar, 2 tablespoons melted lard and enough flour to make nice elastic (non-sticky) dough (about 1½ to 2 quarts). Let rise to twice its bulk and knead down. Let rise again and then put in bread pans. This makes two good sized loaves. Bake in hot oven 45 minutes, or till bread is done. Taking milk in-

stead of water and adding seedless raisins (about 3 cups) makes a very nice raisin bread.

Raisin-Nut Cake.—One cup sugar creamed with ½ cup shortening. Add 2 eggs, 1 at a time and beat well. Gradually add 2 cups flour with 2 rounded teaspoons baking powder and pinch of salt alternately with ½ or ¾ cup coffee. Flour ½ cup seedless raisins and add also ½ cup almonds or other nuts. Bake in a tube pan and cover with this icing: One cup powdered sugar with enough lemon juice added to make it spread.

Orange Layer Cake.—Cream ½ cup shortening, 1 cup sugar and add 2 well beaten yolks of eggs. To this add pinch of salt and a little grated rind of the orange. Sift together 1½ cups flour, 1½ teaspoons baking powder and ¼ teaspoon soda. Add this alternately to the other mixture with a ½ cup orange juice. Add the stiffly beaten egg white and bake in layers in a hot oven. Icing and Filling: One cup powdered sugar, a little grated rind of orange and enough orange juice to make a paste to spread.

This cake is very good and refreshingly flavored.

Potato Doughnuts—Pumpkin Pie

I am sending recipe for potato doughnuts and pumpkin pie which I have never seen in print and which we consider the best of any we have used.

Potato Doughnuts.—One cup sour cream, 1 cup sugar, 1 cup mashed pota-

Score Cards

YOU know the score cards used by the agricultural college people for judging poultry, livestock, or home products.

Were you—or a group of dentists—to make a score card to help select the best tooth paste for the whole family, you probably would make one like the "Dentifrice Score Card" shown here. And when you compare the various tooth pastes you, like most dentists, would give the high score to Colgate's.

COLGATE'S

Cleans Teeth the Right Way

"Washes" and Polishes—
Doesn't Scratch or Scour

Here are some of the reasons why Colgate's stands first in the choice of farm people and dentists.

Non-Gritty—Colgate's is made of fine, specially prepared chalk—no grit. The U.S. Health Service says a dentifrice should not be gritty.

No Drugs—Colgate's has no drugs or chemicals which harm mouth or gum tissues.

Safe—Colgate's is safe—no harsh grit.

Cleans—Colgate's loosens clinging particles and washes them away.

Flavor—Colgate's has a delicious flavor which makes tooth brushing a pleasure. Use Colgate's after every meal.

Container—Colgate's comes out like a ribbon—lies flat on the brush.

Price—Colgate's costs only 25c for a LARGE tube. Why pay more?

More dentists recommend Colgate's than any other dentifrice. If your store doesn't have all the Colgate products mentioned in the coupon, check those desired and mail it to us as indicated.

COLGATE'S RIBBON DENTAL CREAM

DUVAL COMPANY
1209 Bonita Avenue Berkeley, Calif.

When Writing Advertisers Please Mention Cultivator.

toes, 3 eggs, 4 cups flour, 4 teaspoons baking powder, 1/2-teaspoon soda, 1/2-teaspoon salt, 1/2-teaspoon vanilla, 1/2-teaspoon lemon. The fat for frying should be not less than three inches deep in kettle and hot enough so doughnuts begin to brown as soon as they come to the top, but do not have the grease hot enough to smoke. Turn doughnuts as soon as they come up

Drain on soft paper and when cold roll in powdered sugar.

Pumpkin Pie.—One cup pumpkin, 1 tablespoon flour, 1/4-teaspoon salt, 1 cup sugar, 1/2 teaspoon ginger, 1 teaspoon cinnamon. Mix all together thoroughly, then add 1 cup rich milk or cream. Bake in quick oven.—Mrs. Otis O. Carpenter, Earlimart.

HOUSEHOLD QUERIES

Canning Artichokes

I would like to know if you can give me any information in regard to the canning of artichokes, also how to tell when the artichoke is ready for picking. Have been a subscriber of your paper for a long time and have found some very interesting and useful articles in it.—Subscriber, Los Altos.

Gather as soon as the flower buds are well formed and before the scales begin to open. As to canning, Cruess in "Home and Farm Food Preservation" says: "Trim off hard tips and stems and outer leaves. Parboil or blanch in boiling water five to ten minutes. Chill slightly in cold water, pack into jars or cans, whole if possible. Cut to fit can if necessary. Fill with boiling hot brine, three ounces salt per gallon, and four fluid ounces lemon juice or very strong vinegar per gallon. Seal and sterilize by keeping one hour in boiling water if in tin and one and one-half if in glass.

YOSEMITE NATURE GUIDE SERVICE

Yosemite national park nature guide service will be maintained this season. Last year 52 lectures and campfire talks and over 100 field trips were given, and there was a free wildflower show in Yosemite village throughout the entire tourist season, as well as sleeping bag trips into the high Sierra back of Yosemite. The 1922 program will be on a still wider plan and will include lectures and field trips at the back country lodges, such as Tuloume Meadows and Merced Lake. The California Nature Study League will continue to furnish modest nature study libraries. Anyone puzzled regarding birds, animals, insects, wildflowers or trees found along Yosemite national park trails may obtain information about these without charge at the office maintained by the national guide service in Yosemite village.

TO KEEP YEAST

The following plan has been found successful in keeping yeast where a fresh supply cannot be secured daily. Put an inch of salt in a Mason jar, a cake of yeast wrapped in tinfoil, a half-inch of salt, another cake of yeast and so on until the jar is full. The top layer should be an inch or more of salt. Screw on the cover and place in icebox or cool place. It will keep two weeks or more.

WE'RE A-PULLIN' THROUGH

Times a-changin'—
New work to do,
Brand new future
That's callin' you,
And the sky looks stormy
When you prayed for blue,
But, somehow, brother,
We're a-pullin' through!

Storm's a-weavin'
Of a rainbow true,
An' it's made of stars
That are far from view;
Oh, we'll glimpse the glory
Of the mornin', too—
Somehow, brother,
We're a-pullin' through!
—Frank L. Stanton.

THE SEASONS—BACK EAST

When it comes to the end of the Winter,
I'm glad for the joys of the Spring,
And then I begin to remember
The treasures that Summer will bring.

And when I've been cooked to a grease spot,
Or choked by humidity haze,
I pine and I long with affection
For medium-done Autumn days.

And then when the beautiful fall
Has cooled off my mid-summer brain
I think of the snow and the ice,
And wish it was Winter again.

I greet every season that comes,
And like it; but isn't it strange,
That half of the joy of the year
Is knowing the seasons will change?
—Nan Terrell Reed.

You never heard the bee complain,
Nor heard it weep or wail;
But if it wish it can unfold
A very painful tail.

The Cultivator Patterns

3921—Child's Play Dress. Cut in 4 sizes: 1, 2, 3 and 4 years. A 2 year size requires 2 1/2 yards of 36 inch material. Price 10 cents.

3926—Misses' Dress. Cut in 3 sizes: 16, 18 and 20 years. To make the dress for an 18 year size requires 4 yards of 44 inch material. The width at the foot is about 2 1/2 yards. Price 10 cents.

2918—Girls' Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size requires 4 1/2 yards of 36 inch material. Price 10 cents.

3705—Ladies' House Dress. Cut in 7 sizes: 28, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size will require 6 1/2 yards of 27 inch material. The width at the foot is 2 1/4 yards. Price 10 cents.

3920—Child's Dress. Cut in 4 sizes: 2, 4, 6 and 8 years. A 6 year size requires 2 1/4 yards of 36 inch material for the dress and 1 1/2 yards for the gumps. Price 10 cents.

3910—Ladies' Dress. Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The 34 inch size requires 3 1/4 yards for the slip of 44 inch material and 2 1/4 yards of 40 inch material for the bolero. The width at the foot is 2 1/4 yards. Price 10 cents.

3919—Junior's Dress. Cut in 3 sizes: 12, 14 and 16 years. A 14 year size requires 3 1/2 yards of 40 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3448—A Pleasing Apron. Cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42; extra large, 44-46 inches bust measure. To make the design for a medium size will require 4 1/2 yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

Jerseys
May 9, Geo. H. Thomas & Son, Hynes.

Herefords
April 20, H. M. Barngrower, Stockton.

Berylwood Stock Farm, Hueneme, reports sale of Ormsby Douve Romeanna, a yearling bull by Sir Ormsby Skylark Rauwerd, out of Douve Pontiac, a three-year-old who stood ninth last year in the 30 day butter fat competition. The seven nearest dams of this young bull average nearly 29 pounds for seven days, his dam making nearly 800 pounds in 305 days as a three year old and his great granddam 925 pounds in 365 days. This youngster went to head the splendid little herd of A. R. Buttels at Wasco, the consideration being \$1,000.

G. L. Strobeck, owner of Edgemoor Farms, will hold complete dispersal sale at public auction, Hynes, within 50 days, of 120 head of Guernseys, 40 in milk; 60 open and bred heifers and 20 bulls, all tuberculin tested and guaranteed in every way. C. L. Hughes of California Sales and Pedigree Company will handle the sale.

The executive committee of the Kern County farm bureau dairy department has decided to hold a "Dairy-men's Day," to take the place of the county fair scheduled for October. Dairy products will be exhibited; good dairy stock will be shown, and the day will be generally devoted to the dairy industry.

The announcement this week of the dispersal sale of the famous Ormondale Ranch herd of Shorthorns will prove of more than passing interest to the cattlemen of the West who have come to regard this herd as one of the leading collections of Shorthorns owned on the Pacific Coast. The herd was established a number of years ago, and through the service of the bull, Golden Goods, Jr., at once attracted

attention by the character of its productions. It was on this ranch that the famous cow, Little Sweetheart, that was shown to the American championship by T. S. Glide, was dropped. She was a daughter of the bull mentioned above, and the herd at present contains many of her half sisters. The sale is made necessary in a reorganization of the plans of the owners, who will probably subdivide the ranch. About 60 lots will be cataloged and will represent many of the popular Scotch families as well as the better known American tribes. A considerable part of the offering will consist of the get of the \$12,000 imported bull, Boquian Guinea Stamp, and the real feature of the sale will be the crack young bull, The Caledonian. The sale will be under the management of C. L. Hughes of the California Breeders Sales & Pedigree Company, Sacramento, and will be held at the ranch near Redwood City on May 4.

A draft sale of Herefords will be held at Stockton, April 20, by H. M. Barngrower. Mr. Barngrower, who has been closely identified with the Hereford development in this state, was formerly located at Santa Clara and for a number of years has maintained a large herd on his mountain ranch in Plumas County. He recently transferred his headquarters to Stockton, and he states that the coming sale will be the first of what he hopes to make an annual event. About 40 bulls and ten females will be offered and it is expected that range men will take advantage of the opportunity to secure what bulls they will need this season.

For the first time in nearly two years California buyers will have an opportunity to attend a public auction of milking Shorthorn cattle when a combination sale is held at Santa Rosa, April 19. The forthcoming sale will include representative cattle from the herds of Thos. Harrison and R. Heckley of Santa Rosa, the John Lynch Ranch, Petaluma, and W. T. Roberts of Penngrove. This strain of Shorthorns is rapidly gaining in popularity throughout the country, and there is developing an active demand in this state. The sale will be under the management of Thos. Harrison, who is one of the pioneer breeders of the West.

J. E. Thorp of Lockeford, well known Jersey cattle breeder, and L. K. Marshall have purchased a 370 acre ranch from the Locke estate, which they plan to develop into a fruit and stock farm.

The most recent livestock organization for California was organized March 17, when a number of Rambouillet breeders met at the home of Professor Gordon H. True, Davis, and launched the California Rambouillet Breeders Association to promote the interest of that breed, and particularly to develop an advanced registry record for wool production. The plan for providing a registry for wool production is new to the industry, but it is expected to stimulate breeders to make more careful matings, to the end that the average production of the breed will be raised. Minimum requirements for advanced registry are: Ewes, 5.25 pounds of scoured wool for 12 months, or 3.5 pounds for eight months; rams, 7.7 pounds for 12 months and 5.14 pounds for eight months. Ewe fleeces must at least grade "fine medium" and ram fleeces as "half blood." Other requirements are that 12 month fleeces must measure 2.5 inches and eight months' clips 1.67 inches. Advanced registry ewes that have two or more offspring to qualify will be entered on the roll of honor, and rams can achieve like honor when ten or more of their get are admitted. The conduct of the new work will be in charge of Professor J. F. Wilson.

The Long Beach polytechnic high school junior farm center is starting its pig club on a feeding contest. At the end of the contest in May a fair will be held and prizes awarded for the best work. The Southwestern Berkshire Congress is offering a silver trophy to the winning boy in the pig club contest regardless of what breed of pig he wins on.—Geo. A. Stingle.

COMPARE THE PRICE OF

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

VIGOROUS COWS; HEALTHY CALVES

**Calkins No Longer Fears
the Calving Period**

Every cow-owner knows the strain of calving on a cow's system. Kow-Kare is so widely used by dairymen before and after calf-birth to strengthen the genital organs and avoid disorders, that we receive yearly thousands of letters from grateful users. G. H. Calkins, Ione, Oregon, writes:

"I have a fine Jersey cow. When two years old she dropped twins; they came dead. She didn't clean and four days after I tried to take the afterbirth but could not. I got an experienced man and he tried and failed, and then I began giving her Kow-Kare and in about fourteen days it came away all right and she has not seen a sick day since."

Kow-Kare is equally sure as a remedy for Barrenness, Abortion, Scouring, Bunches, Milk Fever, Loss of Appetite, etc. All of these ailments result from sluggish genital or digestive organs. It is these organs that Kow-Kare is quick to strengthen and build up.

At a cost of only a penny a day, Kow-Kare is used in many of the best dairies to offset the severe strain of winter confinement and rough or concentrated feeds. This aid to digestion and assimilation keeps milk production at top notch and avoids breakdowns.

Kow-Kare will help you to bigger dairy profits; try it. General stores, feed dealers and druggists sell it at the new reduced prices—65c and \$1.25

Facts, Lies and Theories

By A. L. Spellmeyer

LIVESTOCK men ask what is the matter with cattle, sheep, and hogs, editors of papers as well as farmers ask what is the matter with agriculture, and the consumers ask why should these farmers be suffering when we pay such high prices, while people in general ask what is the matter with the country and the world.

If the answer to these queries was easy it would soon bring about corrections. Men may assume a theory and be right or wrong, but to even commence the formation of any theory one must have actual facts, and today there is so much fog about the farmer that one may find generally accepted statements have no basis as truth.

There is one truth beyond a question, and that is we are all tiding over for better times, and when the move upwards to a normal prosperity does commence we wish to ride the tide with it. The past two years have been the day of the pessimist and destructionist. The constructive man was in a pit and his efforts to get out brought him nothing but gravel unless he had the financial wings to soar out, and used them like Henry Ford and Hugo Stinnes have used theirs in these last two years.

In this article there is no attempt to answer questions as to economic illness but merely to spike a few false ideas that are generally prevalent as relating to agriculture and livestock.

The actual price at which a commodity sells is the market price and that may be more or less than the natural price. The natural price is the cost plus a fair profit. Monopoly may keep the market price above the natural price, but the market price can seldom continue long below its natural price. The person whose interest is affected feels the loss and withdraws either so much land, so much labor, or so much stock, quantity on the market lessens and the commodity rises to its natural price. This reasoning assumes there is perfect liberty. As the above is part of the foundation of all political economy presumably it is true.

Lie number one I wish to spike is that livestock prices are low today "because the people are not eating meat." While per capita poundage has decreased as it always does when millions of workers are idle, total slaughter numbers are today greater than the average pre-war numbers. My authority for this is actual federal inspection and government statistics which can be easily verified.

Lie number two is: "There are more cattle and sheep than demand can use." There are millions less total dairy and beef cattle in this U. S. A. than in the pre-war period when packers advertised national shortage. The slaughter is millions greater each year than the average slaughter of the years that caused our number depletion.

Lie number three is: "Farm products are low in price because there is no export trade." This is a lie used by bankers and politicians to lead us to a wonderful acclaim of foreign entanglements, as our cereal exports are for 1921 triple the average of the years from 1910 to 1914, dairy products 12 times pre-war average and meat products almost 30 per cent greater than the pre-war average, 1910 to 1914, and only 20 per cent less than when we fed the allied armies during the war period. Truly no greater lies exist than

that lack of exports are responsible for low farm product prices.

There is considerable alarm shown because in 1820 some 87 per cent of the people were engaged in agriculture, whereas in this year of 1921 it runs about 30 per cent, but considering the tremendous advance in farm implement facilities during the past few years this alarm is unfounded. In 1880 44 per cent of the people were so engaged; in 1900, 39 per cent, and in 1910, some 32 per cent. When one figures what a tractor does and what improved machinery accomplishes it is evident our production capacity is much greater than a generation ago.

The conclusion suggests itself that if this is the case in general farming there should be more livestock to consume surplus grains and forage, but again this is impossible, upon present livestock margins.

Another evident conclusion is that if 30 per cent of our people can grow a greater quantity of general agricultural products than needed it must either be exported or our people go into other lines of work.

How are they going to do this when manufacturer is idle? It is plain that the manufacturer of goods must be linked closely with capital advances. With the banks swollen with tight held money surplus manufacturers must close down if an immediate market is not available for the cash purchase of their goods. Goods that people must have are as much actual national wealth as stores of gold, providing they do not deteriorate in style or quality.

The financiers advise all to work hard and better times will arrive. Some 5,000,000 men in this nation have been willing to work, and did work during the war, but have nothing to work at except for a price that lowers their market. Unorganized labor, like cattle, is on a market price basis less than natural price of living expense. The prosperity of a country does not depend upon all men laboring but upon the proportion of employed and unemployed, gauged by the quantity of production. If the banker and the financial captains who urge men to work, loosen up the locks on the bank vaults to production these men will work.

We think of this as a country overflowing with potential wealth, and it is so in a measure. However, we cannot afford the luxury of impoverished soil in congested population districts, abandoned farms, and Orientals exhausting our rich land and moving to new leases. This country is already cultivating one-third of its total productive land. Great Britain today cultivates only 14,000,000 acres of a possible productive 47,000,000. France, Germany and other European countries only cultivate about half of their possible productive acreage, and they have gone the limit. Japan itself cultivates less than a fourth of its total productive land area. The two countries that have weathered the European storm, Denmark and Switzerland, show decidedly opposite methods. Denmark cultivates two-thirds of its total productive acreage and Switzerland, the land of hotels, exiles and tourists, cultivates but a twelfth. Acreage cultivated runs about 20 acres to the man in this U. S. A. and about ten acres in France and Germany.

Some of the above facts, all of which you can verify from official sources, will surprise many folks.

These free booklets on Farm Sanitation

tell you how to prevent disease among livestock and poultry and describe in detail the many uses of

KRESO DIP No.

(STANDARDIZED)

Parasiticide and Disinfectant

No. 151—**FARM SANITATION.** Describes how to prevent diseases common to livestock.

No. 157—**DOG BOOKLET.** Tells how to rid dog of fleas and to help prevent disease.

No. 160—**HOG BOOKLET.** Covers the common hog diseases.

No. 185—**HOG WALLOWS.** Gives complete directions for the construction of a concrete hog wallow.

No. 163—**POULTRY.** How to get rid of mites, also to prevent disease.

Rice and Rice By-Products for Fattening Swine

By E. H. Hughes, University of California

California in 1921 ranked as third state in quantity and value of rice products. Because the state produced such a vast amount of rice, because of the frequent damage to the rice crop, rendering harvesting impossible, because of the comparatively low price of rice, and in view of the fact that many inquiries have been received concerning the value of these products as a swine feed, and because of the absence of reliable information concerning the value of these products, experiments to determine the value of rice and rice by-products were begun at the university farm in October, 1921.

The original plan called for 16 lots, ten hogs in each lot. However, the equipment at the university farm made it impossible to feed more than eight lots with ten hogs in each lot. In the first test, which began October 10, 1921, eight lots were self fed the following rations in dry lot: 1, rolled barley and tankage; 2, rough rice and tankage; 3, rice polish and tankage; 4, rice bran and tankage; 5, rice bran, rice polish and tankage; 6, rolled barley, rough rice and tankage; 7, rolled barley, rice polish and tankage; 8, rolled barley, rice bran and tankage.

In the first test the hogs were fed for 63 days, were marketed by lots, dressing percentages obtained, fat samples taken and are being tested to determine the melting point of the fats, the proportions of olein, stearin and palmitin in the back fat and leaf fat of the various lots.

these tests were hogs produced in the university farm herd and were uniformly well bred hogs.

WOOL STOCKS LOW

Many of the wool importing countries of the world have regained normal prewar consuming bases and are converting raw stocks into finished goods at almost the prewar rate, the department of agriculture announces. The supply in the principal consuming countries is less than has been recorded for some time and is insufficient to meet present demand, inability to obtain stocks being ascribed to unsettled economic conditions throughout the world.

In the United States stocks are probably lighter than in a decade. Manufacturers are operating about on a normal basis as indicated by the monthly rate of consumption.

Stocks in Great Britain, France and Germany are also estimated as lighter than in the last ten years and mills are running to capacity.

Although demand for wools increased after 1913, world production was not increased in the same proportion and the present sheep population of the world is only about 90 per cent that of 1913.

Production in the United States, exclusive of pulled wool, decreased from 250,000,000 pounds in 1919 and 224,000,000 pounds in 1921.

ASSESSMENTS ON AGRICULTURAL PRODUCTS

The state association of county assessors has adopted schedule of as-

Test No. 1

Lot No.—	1	2	3	4	5	6	7	8

Total feed for 100 gain.....	463.20	488.80	354.28	415.00	374.41	450.70	433.50	415.10
------------------------------	--------	--------	--------	--------	--------	--------	--------	--------

Dressing percentage (head off, leaf fat out)....	78.9	76.5	79.0	77.22	73.9	79.9	79.6	78.0
--	------	------	------	-------	------	------	------	------

An exact duplicate of the first test was begun December 31, 1921, and these hogs have been on feed for seven weeks. The results obtained thus far are presented below:

Ave. beginning wt.	87.00	89.6	90.73	88.93	88.07	87.60	88.87	88.20
Ave. wt. Feb. 18, after having been fed seven weeks.....	158.6	139.0	162.6	141.2	153.2	161.0	163.8	155.6
Feed consumed for 100 lbs. gain.....	494.80	479.70	481.00	415.7	388.3	463.3	410.6	469.0
Ave. daily gain.....	1.45	1.07	1.45	1.06	1.32	1.49	1.52	1.37

The following is quoted from a report made by J. O. Snyder of the Western Meat Company:

"Lot 4 killed out soft, but not soft enough to be classed as oily, but what we regularly term as soft. Lot 5 could hardly be classed as really hard hogs or as expressed medium to hard. Lots 1, 2, 3 and 6 killed out hard. Lots 7 and 8 seemed much harder than the others."

The following facts are significant in the first test: The average daily gains were greater than those in the second test. No doubt weather conditions have had something to do with the greater gain in the first test than those in the second. The gains are unusually large when it is considered that they have been fed in dry lot. In addition, gains were made in each case on less than 500 pounds of feed for 100 pounds gain. Pigs used in

essments for 1922: Sheep, \$3 per head; registered milk cows, \$60 per head; common milk cows, \$35 per head; range cattle, \$20 per head; work horses, \$40 per head; work mules, \$75 per head; chickens, \$5 per dozen; turkeys, \$12 per dozen. Rates on grain were fixed as follows: Rice, \$25 a ton; wheat, \$20 a ton; barley, \$12 a ton, and grain, \$15 a ton.

The assessment on automobiles, trucks and tractors will be one-half of the retail prices; one year old, one-third of the cost price.

CHEESE FACTORY FOR GOATS MILK

Humboldt County has long maintained its reputation as a great producer of dairy products. H. A. Snively of Ettersburg has recently added to the number of dairy enterprises in the county by starting a fully equipped cheese factory for goats milk.

PRODUCTION of MILK

Of the Average Cow in the United States and Dairy Countries

Not More Cows—But Better Cows

Compare the average yearly milk production in the United States, of 3,527 lbs. per cow, with that of other countries shown above. You will see at a glance that one of the greatest means of increasing dairy profits is in obtaining better cows.

The cheapest and best way of getting better cows is to raise them. Use a good bull, keep the best calves from your best cows and raise them on De Laval skim-milk, which is a splendid feed when properly fed. In this way you can improve your herd at very little cost.

A De Laval Separator is valued chiefly because it separates cream—a cash crop—better, quicker, cheaper and without waste. But of almost equal importance is the skim-milk it gives, which will replace your present cows with better cows; or as Pren Moore of the University of Idaho says, "when fed to laying hens will bring you as much money as the original butter-fat," while it is without equal for growing pigs.

Milk, butter, eggs, poultry and pork, the best paying crops—a De Laval helps make them possible and more profitable.

DE LAVAL PACIFIC COMPANY
61 Beale Street San Francisco

Sooner or later you will use a De Laval Cream Separator and Milker

FREE! This little booklet tells you how to raise fine calves on De Laval separated skim-milk. It is simple and practical. Sent free on request to your nearest De Laval office.

The original cream separator. Over 2,500,000 in daily use; about as many as all the rest combined. Has won 1,091 grand and first prizes at every important exposition. Skims cleaner, turns easier and lasts longer than any other. The world's standard. Pays for itself. Sold on easy terms. See your De Laval Agent or write for information.

THE 1922 GUARANTY SALE

"THE PACIFIC COAST HOLSTEIN CLASSIC"

65 Selected Registered Holsteins 65

Hynes, California (at Rhoades & Rhoades Sale Pavilion)
Wednesday, April 5, at 9:30 A.M.

CONSIGNORS:

AGEE BROTHERS, Rivera; C. W. ANDERSON, Burbank; MANUEL AZAVEDO, Patterson; H. G. BALL, Tulare; E. D. BARRY, JR., Covina; DEAN BEEMAN, Woodland; BLENKIRON, PHILLIPS & DONDEERS, Fresno; BRIDGEFORD HOLSTEIN CO., Patterson; BURR FARM, Los Angeles; MRS. ANNIE DONDEERS, Fresno; FRED HART-SOOK, Lankershim; FRANK M. HELM, Fresno; W. J. HIGDON, Tulare; THE McLEOD RIVER LUMBER COMPANY, McLeod; A. W. MORRIS & SONS CORPORATION, Woodland; CARL RAY, Lankershim; HARRY L. REDD, Corcoran; J. L. SEBASTIAN, Wasco; TOYON FARM ASSOCIATION, Los Altos; E. J. WELDON, Sacramento.

This offering affords one of the most remarkable opportunities for selection of high class registered Holsteins ever presented in the West, including

The highest record cow ever offered in a Pacific Coast public sale.

Daughters and sons of California's most famous sires out of correspondingly great dams.

Females bred to the greatest list of high record bulls yet presented in a Western sale.

Every animal guaranteed to be a breeder, tuberculin tested, and sold subject to 60 day retest by the buyer.

Be sure and attend this sale. It is the Fifth Annual Guaranty Sale in California, and the cattle are equal if not superior to those in any previous like offering.

Care and Handling of the Milk Goat

By J. M. Holcomb

IN feeding the milk goat the same principles apply which govern the feeding of dairy cattle. As a rule some concentrates are fed, such as barley, oats, wheat, dried beet pulp, coconut meal, etc. The quantity varies, heavy milking does receiving as much as two pounds per day, rarely more. Alfalfa hay is well liked and when supplemented with a little grain hay occasionally they do not tire of it. Succulent feeds such as roots, silage, etc., are highly desirable. A large pasture over which the goats may roam will tend toward contentment, giving them a chance to get the variety which they so enjoy. Well kept goats are particular in regard to the cleanliness of their feed and water. When in milk the goat should be fed twice daily in clean convenient troughs, the hay being fed best in a rack. To prevent waste chain the goat to the stanchion.

The buck should not be allowed to run with the herd as if he does the milk will acquire a goatly flavor and does may be bred too early and it will be difficult to keep an accurate record of the breeding dates, which

tends to prevent necessary attention being given at kidding time. Keep him as far as possible from the does, in good condition throughout the year, and during breeding season feed some grain. A well conditioned, robust buck should breed around 50 does.

The doe may be bred at six months of age, but this early breeding may result in dwarfed stock and mediocre milkers. Does bred at about 18 months of age will come fresh at two years; the period of gestation being about 152 days. If possible pregnant does should be alone for two or three weeks prior to kidding. A warm bran mash given at kidding time is a good laxative. When kids are to be hand fed they are usually left with the does for five or six days to give them a good start.

Where the ground is soft the feet need considerable attention. Much trouble may result from ill kept feet.

Houses are of all styles and sizes but should be well ventilated and easy to clean and disinfect. The yard should be well drained and both the lot and house cleaned frequently. Goats do not care a great deal for lit-

ter, a sprinkling of sawdust to absorb the moisture being sufficient.

The milking rack should be apart from the barn on account of odors and dust and dirt which the other animals stir up. Twice a day milking is usually sufficient; but with heavy producing does three times will not only relieve them but may increase the milk flow. Lumps which sometimes appear in the udder after freshening may cause the doe uneasiness at milking time. Gentle rubbing of the udder with a lard and turpentine salve will help to reduce swelling and relieve soreness. If promptly cooled to below 60 degrees the milk can be kept for several days.

states. The Southern California Holstein Breeders' Association has mapped out a plan to show visitors some of the great Southern California Holstein herds following the sale, with W. R. Harriman, superintendent of Los Angeles County farm, in charge of the program. On Saturday, April 8, it is expected that many of the visitors from other sections will visit River-side, where Dairy Day will be in progress, and it promises to be an event well worth staying over to attend. The board of directors of California Holstein-Friesian Association will meet on the evening of April 4 at the sale headquarters, Angelus Hotel, Los Angeles, and altogether it promises to be a real Holstein week.

GUARANTY SALE OF HOLSTEINS

Catalogs for the 1922 guaranty sale have been distributed and the committee of selection for the California Holstein-Friesian Association has done its work well from indications of the pedigrees. It is also claimed that the entire offering of 64 head will present the most attractive average type yet found in the annual California state sale. The preliminary announcements of this sale brought forth the heaviest inquiry for catalogs ever made for a California sale, and the demand covers practically every section of California and several from outside

HOLSTEIN BREEDERS' TRAVELING INSTITUTE

The Southern California Holstein Breeders are to act as hosts to Holstein breeders of the northern end of the state in meetings and luncheons on April 6 and 7. In fact, the meetings may well be termed sessions of a field institute. There will be a general mingling of pleasure and profit.

On the mornings of April 6 and 7 at 9:30 the Holstein men will gather at the Angelus Hotel, Los Angeles, and the first day will visit Burr Farm, Earl Graham, County Farm for luncheon, Agee Brothers, Pellissier and

THE SALE YOU HAVE WAITED FOR!

60 Registered Milking Shorthorns

SANTA ROSA STOCK FARM

Santa Rosa, Cal. Wednesday, April 19

FROM THE FOLLOWING HERDS:

Santa Rosa Stock Farm, Santa Rosa; John Lynch Ranch, Petaluma; W. T. Roberts, Penn Grove and R. Heckley, Santa Rosa.

40—FEMALES—40

All the mature cows have records of milk production and the heifers are from dams of proven production. As a whole or individually they are a superior lot of correct type and producing bloodlines.

16—YOUNG BULLS—16

The bulls comprise as strong a lot as were ever offered in the West. A number of herd bull prospects of high order and all are capable of implanting increased milk production in your herd.

The sale will feature the get and services of the noted bull, Count Tickford, champion at many shows and counted one of the best bulls of America.

For any information write

Thos. Harrison, Sales Manager, Santa Rosa Stock Farm
Santa Rosa Calif.

SEMI-DISPERSAL REGISTERED 60 HOLSTEINS T. J. GIST & SONS HERD TULARE, CALIF. Wednesday, April 12, at 10 A.M.

T. J. Gist & Sons will sell in this sale all of their milking females and bred heifers, retaining only their open heifers and heifer calves for foundation of another herd.

THERE ARE A LARGE NUMBER OF HEAVY PRODUCING FRESH COWS IN THIS SALE, MANY WITH OFFICIAL RECORDS UP TO OVER 26 LBS. BUTTER IN 7 DAYS.

This well known herd represents most substantial breeding, the females are practically all young, and they will be presented in excellent physical condition.

35 COWS AND HEIFERS IN THE SALE ARE BRED TO KING SYLVIA SEGIS COLANTHA, A GOOD SON OF THE \$106,000 BULL CARNATION KING SYLVIA.

The sale will be held on the T. J. Gist & Sons Farm, about five miles north of Tulare. Every animal guaranteed to be a breeder; no tuberculin test certificates.

TERMS OF SALE: Responsible parties may arrange terms, if done before sale, of one-third cash, balance in three, six, and nine months with note bearing eight per cent interest. Applications for credit should be made to sale managers.

Water direct from well to drinking cup

Anita Baldwin. The second day's trip, starting at same time and from same place, will include visits to the ranches of Charles Anderson, Fred Hartsook, where luncheon will be served, Carl Ray, Maxwell Farm, L. A. Creamery San Fernando Valley Farm and Sunshine Ranch.

These field days are to follow the great guarantee consignment sale at Hynes on April 5, when 64 top registered Holsteins will be disposed of. These animals are consigned by a score of California's best breeders. Wm. R. Harriman of L. A. County Farm is in charge of the two days' program and it will be one long to be remembered by Holstein breeders.

CALIFORNIA HOLSTEINS SENSATION OF BRENTWOOD NATIONAL

Bridgford Holstein Co., Patterson, were the sole consignors from California to the Brentwood National sale at Philadelphia, March 20-23, and furnished the real sensation of the sale. In the show which preceded the sale, with four entries in a class of 25 heifers Bridgford won first, second, fourth, and fifth. The daughter of King Segis Alcartra Prilly out of Adironac Wietske Dairy Maid topped the females at \$4300. The cow Gerben Colantha Parthena was first in the mature class in the show, and reserve champion, and sold in the sale for \$3100. She is the dam of the great young bull consigned by Bridgford Holstein Co. to the 1922 Guaranty Sale at Hynes on April 5. The entire Bridgford consignment of 17 head averaged \$1385 at Philadelphia, and the daughters of King Segis Alcartra Prilly made an average of \$2070. The above mentioned son of this sensational sire, and a yearling daughter of a 32 pound granddaughter of Colantha Johanna Lad will appear in the Guaranty Sale at Hynes on April 5. Something of the quality of the Bridgford cattle when brought into competition with the tops of the entire United States is evidenced by the top average in the Brentwood sale, by the winning of four out of the first five places in the big heifer class, and by the fact that they were the only exhibitors in the show to win more than one first prize.

Over 50 Berkshire breeders and their friends were entertained with a chicken dinner by Secondo Guasti, Jr., manager of the Italian Vineyard Company, at Guasti, on March 24 in honor of Mr. and Mrs. John Fritsch of Pennsylvania. Mrs. Fritsch is one of the most prominent breeders of Berkshires in the East and since she was unable to arrive in California in time for the American Berkshire Congress at Riverside this means was taken to show her some of the enthusiasm felt for the Berkshire in Southern California. Alex. Wilson, superintendent of the livestock department of the Italian Vineyard Company, acted as toastmaster and a delightful time was the result.

The animal husbandry division of the college of agriculture has received an oil painting of the world champion fat heifer, Lulu Mayflower, that was shown at the last International. The painting, presented to the institution by John Clay of Chicago, head of the commission firm that sold her, is the work of the famous animal artist, N. A. Troop.

VETERANS IN THE HARNESS

"Horse Profits" is the title of one of the most attractive booklets we have seen. The cover has for decoration an old time combined with its 21 horses just coming over the hilltop in a field of oats. The title is "Veterans in the Harness." No movie star ever played the part better. Inside the booklet there is "a discussion of plain horse sense facts, revealing the reasons for a farmer's everlasting faith in animal power." There are tables and text giving a fund of information as to the earning power of brood mares, rations for them and their colts, statistics as to the number of animals in California, and, finally, discussion of "Facts About Harness" and the making of a good harness.

There are illustrations of ordinary team harness, chain trace harness, butt chain harness, single and express harness. In saddles there are illustrations sufficient to drive a California

cowboy wild with delight. It is not so much a catalog of harnesses as a few well gathered facts regarding the horse and his equipment. It is published by the Lichtenberger-Ferguson Company, Third and Los Angeles Streets, Los Angeles. We presume every horseman who writes to the Lichtenberger people may secure a copy of the booklet.

FOURTH ANNUAL BELGIAN HORSE SHOW

The fourth annual international Belgian horse show will be held September 25 to October 1, 1922, at Waterloo, Iowa. This exhibition is unique in that it is the only single breed horse show held in America. Its rapid growth during the past three years has done much for the development of the draft horse industry and especially the popular breed of horses which it fosters. Last year there were more than 250 Belgian horses exhibited.

1922 DAIRY CATTLE CONGRESS

September 25 to October 1 are the dates of the thirteenth annual Dairy Cattle Congress to be held at Waterloo, Iowa, the show's permanent home. With the remarkable increase in attendance last year, when practically all shows and fairs suffered a large decrease in comparison to 1919 and 1920, the management is beginning arrangements for this year's show under very encouraging conditions.

With the dairy cow converting low priced grains and hay into milk and butter fat, at good values, the farmers of the Mississippi Valley are rapidly turning to dairying as the one sure way to success. Hundreds of communities in Iowa, Missouri, Nebraska, Kansas and the Dakotas are cooperatively purchasing grade and pure bred dairy cattle in large numbers. Creameries are being built in many localities which heretofore have been considered beef producing strongholds.

"The Tavern of the Ocean" is the old name given to Capetown. What a suggestive name and how welcome it must have seemed to ocean voyagers on the long sail from Europe to the Indies!

MR. FARMER:—

You are contemplating the purchase of a service bull next year. Why not save 50 per cent of the purchase price by buying a registered Holstein bull calf now? Pay for him next year when he is ready for service.

Sons of SIR VEEMAN KORNDYKE PONTIAC, who has 27 A. R. O. daughters, and of BURR WALKER SADIE VALE, whose seven nearest dams average 29 lbs. of butter in 7 days, included in this offer. Call or write at once.

horse profits

No. 1 of a Series

Published Monthly in the Interests of Better Horses and Better Harness

Louis Lichtenberger, Editor

HORSES HAVE NEVER FAILED THE FARMER

The future of the Horse on the farm is established. The Farmer today, more than ever before, has unstinted faith in his Horses—convinced by observation and comparison that his Horses can do the work cheaper, more efficiently than other forms of power. The U. S. Dept. of Agriculture, in a recent Bulletin, states that the average cost of feeding a horse is 45c per day—actually less than the depreciation on a power machine alone. The majority of farmers who have used both machine power and horses unhesitatingly give preference to horses.

465,826 Horses and Mules on California Farms

There is an average of almost five head of horses on every California farm serving perhaps 90% of farm power requirements. The average number of horse working days in California is 275 days. There are more than 26,000,000 work animals in the U. S.

16 HORSE SENSE FACTS

1. Horses are never second-hand.
2. Horses have a steady market value.
3. Horses average 15 years of service.
4. Horses never require "overhauling."
5. Horses consume the cheapest fuel.
6. Horses never break down when treated humanely.
7. Horses do not require high-priced operators.
8. Horses furnish the only successful power for uneven contoured land.
9. Horses do not cause formation of hard pan.
10. Horses cost less the more they are worked.
11. Horses contribute fertilizer to the farm.
12. Horses (mares) produce replacements and earn extra profit.
13. Horses give the most flexible power.
14. Horses do not "rust out" when idle.
15. Horses cost a fraction of power machines.
16. Horses furnish over 95% of the field power on American farms.

SUPERIOR BRAND HARNESS Meets California Conditions Best

With an average of 275 horse working days per year in California, or twice that of eastern States, it behooves every Farmer to select the finest and most durable harness for economy's sake. Superior Brand Harness is backed by a reputation of 25 years standing and has proven its merit. Ask your dealer to show you Superior Harness—accept no substitutes.

We have just published an interesting book entitled "Horse Profits," which gives information regarding horses and harness. Send for a copy.

Largest and Best for Over 50 Years

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Write today for Circular.

Winning at the Fair

By H. L. Musser

Mr. Rancher, do you stop to consider that your organization is not up to the standard of stockmen and fruitmen in your exhibits at the county fair? The stockman begins to grow his prize heifer long before it is born by mating prize parents, and from the time of its birth it receives scientific attention. If the young heifer is born physically perfect it must win a prize. This is not only true in the case of a heifer but in all lines of livestock, from the thoroughbred horse to the Guinea pig and from the turkey to the bantam. The result of this scientific forethought is that prize stock and the offspring of this prize stock are sold at prices much in advance of common stock.

The fruitmen have not yet attained the point reached by the stockmen, but they are much in advance of the grain rancher and the vegetable grower. Have you observed at your county fair that the exhibits of grain are largely freak plants, or abnormal growth brought there either by some real estate interests or simply because it is a freak? Have you also noticed that the vegetable exhibits are mostly abnormal? And, too often the judges award the prize to this class of exhibits.

Mr. Grower, follow the example of the stockmen. First consider well your local climatic probabilities for the season, nature of the soil, its chemical needs and physical condition. Determine what class of vegetation will best thrive with your conditions, whether corn or other grain, melons or other vine crops, potatoes or berries.

Whatever you may decide upon, consider next the time to plant in order to attain the highest perfection when the fair is on.

Seeds, you will readily concede, are the most important. Good seed is the parent of the crop, just as is the registered stock parent to the prize heifer. When selecting your seeds let me suggest some prize winners. Should you decide you will grow corn for grain, the Orange County Prolific has not been excelled, but it is rather late to mature, therefore it may be better to grow King of the Earliest. If you are a dry farmer, this variety will bring you a prize because it will win with less moisture and mature in less time than other varieties.

With normal conditions corn will mature within 90 to 110 days, according to variety, but the time varies so much with climatic and cultural conditions that no certain number of days may be depended upon.

If you will determine to grow corn for the silo, the Eureka or Mexican June will give more tonnage, but in quality the Orange County Prolific again wins and is not far behind in quantity.

For sorghum of quality for the silo, grow Texas Seeded Ribbon Cane; Honey Sorghum is a close second. For syrup, select Silver Tip.

Dwarf Milo Maize has the record for tonnage in grain. For the silo, what it lacks in tonnage it makes up in quality.

Hegari should be encouraged by the growers of prize crops. The same is true of White Yolo, but seed is not yet available for liberal distribution.

The Wonder Forage will win any prize where individual plant is the sole consideration. It will also grow more tonnage of green feed per acre and make better dry fodder than any other sorghum.

You should select Klondike watermelon for quality, White Seeded Angelino for beauty, and Excel for size.

Shape and quality alone should count in cantaloupes, not size. Armenian, Famous Indiana, Tip-Top and Triumph.

In casabas size should be considered, along with shape and quality. The Large Hybrid, Golden Hybrid and the Golden Beauty and Santa Claus all should bring a prize. Where dry farming succeeds it should have some consideration with the judge.

Vegetables include everything in the range of the alphabet, from asparagus to turnips.

Prize winning vegetables, size and type considered: Cabbage, Autumn King; beans, Superior Kentucky Wonder; celery, White Plume; carrot,

Mastodon; beet, Mammoth Long Red; cucumber, Lemon, Klondike, Italian; egg plant, New York Purple; kale, Tall Jersey; okra, Mammoth Long Pod; onion, Riverside Sweet Spanish; peppers, Anaheim Chili, Chinese Giant, Pimiento; sweet potato, Nancy Hall; pumpkin, Large Cheese; radish, Japanese Summer; squash, Banana, Italian; Roselle; tomato, Boulder; turnip, Purple Top Globe.

Berries: Any berry that is in full season at fair time should win a prize. Here are some possibilities: Strawberries, Carolina, Progressive, Everbearing; raspberries, St. Regis; blackberries, Macatawa.

Flowers and bulbs: For flowers and bulbs we advise that you study your catalog in order to determine what you would grow. There is much competition at flower shows, therefore we suggest that you try something odd, out of the line of the usual display.

INTEREST IN IRRIGATION AT CHICO

Landowners around Chico are intensely interested in a movement to establish an Irrigation district in that section. It is expected that petitions shortly will be in circulation and the project completed as soon as possible.

Until recently sentiment in favor of irrigation in Chico and thereabouts has been more or less dormant—mostly more. Conditions have made it easy to grow big crops with little labor. The soil is a rich volcanic formation and the water plane is near the surface. In extra dry seasons those requiring water have merely driven a 25 foot pipe into the ground, dropped a half stick of dynamite through it, hitched on a pump and pumped out the sand and water and in a couple of hours they were irrigating.

But with the coming of high costs of farming and the downward trend of prices for products a change of sentiment has taken place. The pumpers are beginning to feel the expense of pumping. Others who in the past were able to farm large tracts and produce grain at a profit are finding it not so easy. They are looking to some way out—some other crops that will pay better. Such crops they now realize can be grown only under ditch.

The pro-irrigationists are using as one of their main arguments the probable breaking up of the large holdings if the project is put through. They see as a result the subdivision of the big ranches and their settlement by small landholders. Nothing would please Chico better. As the center of a big and rich country it is laying its plans to develop its tributary territory to the utmost, realizing that in the prosperity of the farmer lies the prosperity of the community. One of the factors in farm prosperity is a diversity of crops, and a diversity of crops can come only with irrigation.

NEW FILMS SHOW ROAD BUILDING

Close-ups of the activities of the bureau of public roads are contained in two films recently released, "Building Bituminous Roads" and "Mixed Asphalt Pavements." The new films show how Uncle Sam, who has become the world's greatest road builder through the federal aid road act, makes use of bituminous materials in the construction of the nation's highways.

SAVED ON BULK HANDLING

A Cultivator subscriber writes: "In 1915 I saw Moreing Brothers handle some 25,000 acres of wheat in bulk, dumping grain into a receiver, which conveyed the grain to a barge. Grain standing in the field would be in the elevator by evening. It was said Moreing Brothers saved about \$35,000 on sacks."

The Hairy Peruvian Alfalfa Seed Growers Association of Arizona has engaged J. W. Longstreth as agronomist for this season's certification work in Yuma Valley, where the seed for their Red Seal brand Hairy Peruvian is grown. Spring is the best time to do this work, and they plan to cover the entire acreage and have it completed well before harvest time.

FROST PREVENTION MEETING

The people of the Covina district are moving for a thorough investigation of frost fighting methods and appeal to all the growers to take an interest in the work of the committee which has been appointed. A mass meeting has been called to be held at Covina on the evening of April 4. L. D. Ratekin of the committee, Mayor Stanton of Covina and other prominent citizens and ranchers are members of the committee. Edward Insley is secretary.

At the initial meeting held by the orange growers many maintained that the use of the ordinary orchard heater has not been a success and that investigations along other lines should be encouraged. Especial effort will be made to investigate the advisability of using blowers for creating air currents and bringing down warm air from the upper strata. There has been one heating plant test in a limited way during the past season and patent has been applied for on it. This was in the orchard of Mr. McKenzie of Pomona.

As was noted in last week's issue of the California Cultivator the Fruit Growers' Supply has a strong committee at work but it is working entirely along the line of perfecting the orchard heater. The windmill type or fan blower has been suggested many times and very limited experiments have been made with it. As a rule fruit growers have little faith in its efficiency in time of extreme cold.

It is understood that at the Covina meeting April 4 walnut growers will affiliate because of possible injury to the walnut from late spring frost.

NEW BUILDINGS AT UNIVERSITY FARM

According to announcement by Thomas F. Hunt the University of California is making good in its improvements of the facilities at Davis. Two permanent buildings are under construction. Both will be ready for occupancy at the opening of the college term in August.

The largest will be devoted to dairy industry. It will be constructed of hollow tile with reinforced concrete frame and will consist of a two story main structure, 234 feet long, and a dairy manufacturing wing running back 128 feet from one end of the main building.

The university believes that it should make its farm operations most efficient by giving the ranch help proper quarters. There are now under construction in the ranch house group two bunk houses containing individual rooms for the employees, together with an up-to-date kitchen and dining hall. Also in order to render greater service to the farmers there will be erected an agronomy warehouse containing seed cleaning machinery. All of the present buildings on the farm are being painted, and the farm by picnic day, April 29, will present to the public a good idea of what the generosity of the state has done in the way of improvement.

DEPARTMENT ISSUES SECOND REPORT

The second report of the California department of agriculture for the period ending December 31, 1921, has been issued. This report, while covering some 200 pages, of necessity deals only with the major activities of the department, relating to the administration and enforcement of regulatory laws provided by successive acts of the legislature. A remarkable feature of this report is that showing the progressive accomplishments of a

state department hardly three years old and which must be accepted as a direct tribute to the wisdom involved in the late consolidation of agricultural activities. The story of the continued advance of California agriculture is plainly set forth in the bulletin, and cooperation along the lines of agricultural endeavor will aid in a large measure in solving many of the perplexing future problems that confront the state.

This report may be had post free by addressing "The Director, California State Department of Agriculture, Sacramento."

GUIDE FOR AUTOMOBILE CAMPERS

From a study of the recreation travel within and adjacent to the national forests of California the forest service has found that fully 80 per cent of those who travel by automobile are prepared to camp. Appreciating the importance to this large camping public of reliable data on improved camping places, it has prepared a guide.

According to District Forester Paul G. Redington this guide will contain a short description of all the improved public camps on the national forests in California and a list of practically all of the cities and towns in California and Western Nevada that maintain public automobile camp grounds.

"This season," said Redington, "camp fire permits will be required on all the national forests and the Guide, in addition to other information of value to campers, will contain a word of caution regarding forest fires

and a complete list of forest officers, automobile club agencies and municipal and civic organizations that will issue free camp fire permits during the season of 1922.

"This guide will be available for distribution after May 1 at all forest offices, automobile club agencies and automobile camps listed in the booklet."

LET THESE SOAK IN!

Oil your tractor and keep it oiled. Keep the grease cups screwed down at all times. Don't let the magneto wires get oil or water soaked. Strain the oil in the crank case at frequent intervals. You can do more good work on your tractor with an oil can than you can with a monkey wrench.

A DANGEROUS PRACTICE

A Kansas subscriber writes: Please permit me to call attention of your readers to the dangerous practice of throwing boards down with nails sticking from them, and leaving them lying about, a constant danger to barfoot children or anyone with worn thin shoe soles.

This is a very common habit and causes many deaths from lockjaw unless attended to promptly and skillfully.

Better be safe than sorry.—A. L. Patten.

Sawing down trees and cutting logs is made easy by the new combination rigs offered. Some of them have light, interchangeable parts, using the same engine for both jobs.

TRACTOR TIPS

If you would be safe rather than sorry, don't overload.

To run a straight furrow you must look a long way ahead.

Read, study and commit to memory the book of instructions.

Carelessness and abuse are at the bottom of most tractor troubles.

Don't play with your tractor. Be serious. Make power farming a business.

Planning your work so that it can be done with the least possible effort is not laziness but good planning.

In small gardens the asparagus bed may be placed in one corner or in an offset at the end of the garden, and the hills of the rhubarb along the side fence where they will be out of the way of general cultivation. Sometimes the rhubarb or asparagus is arranged in a sort of row or narrow bed across the front of the garden, separating the garden proper from the lawn at the rear of the house. In large gardens everything should be planted in straight rows in order to facilitate cultivation. Dewberries can often be trained upon a fence, and grapes can be grown on an arbor over the garden walk.

Down in Texas some of the largest ranchers have 8 to 15 engines pumping water for stock. Wherever the herd happens to be ranging, they are close to a sure supply of water.

As the world grows more and more civilized we keep right on improving padlocks.—De Kalb Chronicle.

Scrapping warships is Secretary Hughes' notion of a scrap.—Toledo Blade.

McQUAY-NORRIS PISTON RINGS

Get All the Power You Pay For

You can't get all the power that's in the gasoline you buy if your piston rings are worn and leaky. McQuay-Norris Piston Rings stop this waste. They increase power—save gas and oil and reduce carbon trouble. Whatever the make or model of passenger car, truck, tractor or stationary engine, you will find the McQuay-Norris line is complete for every need. Through the addition of

McQuay-Norris Wainwright Pistons and Piston Pins to the McQuay-Norris Piston Ring line, you can now secure for your gas engines complete McQuay-Norris-made Pistons, Piston Pins and Piston Ring equipment.

Send for Free Booklet—a valuable explanation of the relation of piston rings to gas engine operation. Address Dept. AB.

McQuay-Norris Manufacturing Co. St. Louis, U. S. A.

McQUAY-NORRIS WAINWRIGHT PISTONS & PINS

LEAK-ROOF—an exclusive two-piece design, preventing loss of gas and compression. Gives equal pressure at all points on cylinder walls. For all piston grooves except top, which should have **Superoyle**. Each ring packed in a parchment container. Price per ring—

\$1.25

In Canada, \$1.50

Superoyle—Keeps lubricating oil out of combustion chamber. Collects excess oil on each down stroke of piston and empties on each up stroke, which ordinary grooved rings cannot do. Each ring packed in a parchment container. Price per ring—

\$1.00

In Canada, \$1.25

JIFFY-GRIP—a one-piece ring. Non-butting joint which can be fitted closer than ordinary step cut—velvet finish—quick seating. "Seats in a jiffy." To keep them clean and free from rust, each ring is packed in an individual glassine envelope. Price per ring—

50c

In Canada, 50c

Snap Rings—of the highest grade. Raised above the average by McQuay-Norris manufacturing methods. Their use insures all the satisfaction possible for you to get from a plain snap ring. They are packed twelve rings to the carton and rolled in waxed paper.

And Snap Rings of the highest grade

POULTRY

Profitable Poultry News—Capacity 200,000 chicks, hence prices surprisingly low for quality. One recent order of County Farm Adviser's was 5,000 White Leghorn, 2,500 Brown Leghorn, 850 Ired chicks. His orders are coming after two years' extensive trial of our chicks throughout his county. "Had the pleasure of seeing some your Anconas, White Leghorn pullets. They are grand." "Your Barred Rock chicks, bought May, 1919, proved great winter layers." "Can you furnish me 100 Wyandottes or Reds as good as your's last year? There's nothing like them here." These strains, 180-290-egg Leghorns, Rocks, Reds, Anconas, Orpingtons, Wyandottes, Minorcas, Andalusians, ducks, turkeys, yearly lead many egg-laying contests, supply foundation stock, fill repeat orders for hundreds. Why? **ELECTRIC HATCHED**, vigor, growth, winter laying, profit, guarantee. Booking for immediate future delivery, below prewar prices. Smallest, largest orders welcomed. Write **Profitable Poultry**, 13 No. Fair Oaks, Pasadena.

Baby Chicks: When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY**, Santa Ana, California.

Have you had satisfaction with your

BABY CHICKS?

If not, give us a trial. Our chicks give satisfaction.

DAY OLD DUCKS

on orders.

STEELE'S EGG RANCH.

Phone Gardena Exchange 692, Moneta, California.

Baby Chicks from my pure-bred heavy laying strain of S. C. White Leghorns, a result of 17 years of the most careful breeding and selecting for laying and standard qualities. April and May delivery at \$13.00 per 100 and \$12.00 per 100 in lots of 300 and more. Correspondence solicited. J. R. HEINRICH, POULTRY YARDS, ARROYO GRANDE, CALIF.

SEEDS AND PLANTS

SUDAN GRASS SEED (The Great New Hay Crop) First introduced in the United States 1909 from Sudan, Africa.

Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings. **Pasturage**. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than Sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.

Price—5 lbs. \$1, 10 lbs. \$1.50; 50 lbs. \$5; 100 lbs. \$8; 500 lbs. \$35; 1000 lbs. \$50.

STRANGE INDEED!

"You have such strange names for your towns," an Englishman remarked to one of his new American friends—"Weehawken, Hoboken, Poughkeepsie, and ever so many others."

"I suppose they do sound queer to English ears," said the American thoughtfully. "Do you live in London all the time?"

"Oh, no!" said the unsuspecting Briton. "I spend part of my time at Chipping Norton, and then I've a place at Pokes-togg-on-the-Hike."—Harper's Magazine.

HIS PREFERENCE

Willie was in a bad temper. His mother had just discovered that there was not a clean nightshirt ready for him to wear.

"Never mind, Willie," she said consolingly. "You will have to put on one of your sister's nightgowns tonight."

"What! a girl's?" snorted Willie, drawing himself up haughtily.

"Yes. Why not?" asked mother in surprise.

"I won't wear it!" declared the small boy. "I'd rather go to bed raw!"

—Detroit News.

Good taste in food, as in anything else, inclines toward simplicity. That child is handicapped for life who grows up without sound food tastes and habits.

The Cheapest Brooder House

By Jean A. Koethen

THE use of a laying house for brooding chicks is become more and more common among California poultrymen. With the coming in

of the big brooder stove and the electric hover and the passing of the small unit brooders the special brooder house is no longer a necessity. Any vacant laying house may be fitted up with stove or hover and used for brooding 500 to 1,000 chicks, and the saving in expense and ground space is considerable.

An excellent example of one section of a long laying house in use for rais-

this from a laying house to a cold brooder, and the chicks are taught in one lesson how to reach their roosts. C. C. MacDowell, who cares for the White Farm poultry, teaches the chicks to go to bed by the simple device of drawing them gently to and up the ladders with a length of chicken wire. The second night a few scattering loiterers have to be helped. After that the whole flock know their way up the ladder.

The sections or houses which make up this long laying house are 22 feet square, with gable roof nine feet high at the gable, seven feet high in front

Brooder and Other Efficient Equipment on Poultry Farm

Figure 1. Upper photo: These chicks were brooded in the adjoining house and now use this house as a cold brooder, roosting on strips of 1 by 2 between the regular roosts.

Figure 2. Lower photo: Notice the outside hoppers and the adjustable shutter which is turned up for the chicks in the house at the extreme right and down for the hens. Each section of this house is 22 by 22.

ing chicks was seen recently on White Oak Farm, near Ventura Boulevard, owned by Mr. and Mrs. Ludwig. Figure 1 shows November chicks, now nearly three months old, enjoying the sunshine in the doorways and yard of their house. The house in which they were brooded adjoins this on the left and is fitted with curtains so that the front can be tightly closed while the chicks are small. A 500 chick electric hover is used on the floor of this house, which is covered with sand and straw. A low door and inclined runway give access directly from brooder house to run. Half a dozen small roosts made of inch wide slats or batens provide the chicks with opportunity for learning to roost.

At the age of two months, when heat is no longer needed, the chicks are transferred to the adjoining house in which they are seen in the cut. Lath ladders extending from floor to droppings board and an extra roost between each two regular roosts are the only equipment needed to turn

and five feet high at the back. Four feet of the front is enclosed, the remaining three feet being covered with wire and an adjustable shutter. The nests are under the roosts and the feed troughs and water fountains outside along the front. Figure 2 shows three sections of the house, two of which are occupied by hens, while the third, at the extreme right, is occupied by the growing chicks.

FEDERATION OF PRODUCERS' ORGANIZATIONS

The Petaluma Poultry Journal reports that at a recent conference plans were made for a federation of the Pacific Coast poultry producers' associations under a board provided by joint action of all of these societies. The plan under which the organizations will act together resembles proposals which have been made for coordination of activities of the various wheat growers' associations throughout the country.

The central federation will not de-

tract from the operation or affect the power of any of the organizations, but will act to cement their work in such

Rid Hens and Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy in Drinking Water Does It. No Dusting, Spraying or Greasing

At this season of the year lice and mites cause many poor hatches. Setting hens infested with them will often desert their nests at the most critical time. They sap the strength and vitality of baby chicks. Many dusts, sprays and dips are so strong that they often make eggs unhatchable. Greasing setting hens or baby chicks is disagreeable and unsanitary.

A wonderful new discovery has recently been developed which makes it easy to keep the whole flock, especially setting hens and baby chicks, absolutely free from all lice and mites. Just a few drops of Imperial Lice and Mite Remedy, given occasionally to fowls in drinking water, keeps them entirely free from all vermin. It is a simple remedy in highly concentrated form, and is guaranteed not to affect eggs or flesh of fowls in any way. Lice, mites, ticks and other vermin will not stay on any fowl when this remarkable remedy is used in their drinking water. It is also a splendid spring tonic and blood purifier for the entire flock.

White Diarrhoea Remedy Free

The manufacturers of Imperial Lice and Mite Remedy, in order to get it quickly established and widely used, are making a special introductory offer. In connection with your order for a regular full size (double strength) \$1.00 bottle enough to eliminate all lice and mites from the average flock and keep them free from this vermin, they will include free to you as an outright gift, your choice of either a regular \$1.00 package of Imperial White Diarrhoea Remedy (the standard time tested remedy), or a large size \$1.00 package of Imperial Egg Tonic, the guaranteed egg producer. In ordering, send only \$1.00 (check, M. O. or currency) and state your selection. Both remedies sent postpaid.

If more convenient, you need send no money, just your name and address to the Imperial Laboratories, Dept. 555, 2110 Grand Ave., Kansas City, Mo., and pay the postman \$1.00 and a few cents postage when the package containing the two remedies arrives. As this offer may not appear again you should act at once, or elp for future reference. You need not hesitate in ordering, as you risk no money. The manufacturers guarantee to refund the cost any time within 30 days if you are not entirely satisfied.

PACKERS OF AIRLINE HONEY

undertakings as the opening of new markets, the securing of statistical and market information, and to prevent flooding of any one section of the country by shipments from different organizations at the same time.

It is expected that out of the new arrangement a general sales agency in New York and in other eastern markets will be developed for Pacific Coast association eggs intended for export and for Atlantic Coast cities.

The associations represented at a recent conference, in which plans were laid for the federation, were the following:

- Washington Cooperative Egg and Poultry Producers' Association.
- Pacific Cooperative Poultry Producers.
- Poultry Producers of Central California.
- Poultry Producers of Southern California.
- Poultry Producers of San Diego.

Poultry Queries

Conducted by Jean A. Koethen

The Way to Begin

We are thinking of starting a poultry farm in this district. Will you please tell me what opportunities there are in this line? How would you begin the job? We have about \$6,000 capital. How many head should we begin with? How many acres of land are necessary? — Subscriber, Porterville.

If I knew how old you and your

wonderfully good rule for the prospective poultryman.

Ipecac for Blackhead

I would like to know how ipecac is used. I got some from the drug store in powdered form but there are no directions.—Subscriber, Corning.

The Doctors Wegeforth used the powdered ipecac as preventive of blackhead, mixing it in the food of all the birds they wished to keep from taking the disease. The dose was a teaspoon of powder twice a week for 20 turkeys. It was given in soft food, either dry or moist mash, I am not sure which, and presume it makes no difference. It could be mixed in the egg and cereal which is commonly fed to baby turkeys. The dose given to turkeys which already showed symptoms of blackhead was ten drops of fluid extract of ipecac three times a day, given directly by mouth. This dosage was continued three days after which it was decreased to ten drops twice a day for three days, and later to ten drops once a day for three days.

This also answers the inquiry of Campo subscriber in regard to method of administering ipecac.

Leg Weakness

Please tell me the cause of leg weakness in baby chicks three weeks old. They seem healthy, eat heartily, but shift around on their legs about three days, then die.—Subscriber Summit.

Too close confinement and heavy feeding are the two interrelated causes of leg weakness. The most effective cure is to get them onto the ground and keep them there as much of the day as possible. Feed grain in deep litter so they will have to work for it and limit the mash given them. Addition of bone meal to the ration will

records. There are two kinds of trap-nests, one for trapping the individual birds, the other for separating layers from non-layers by letting them through the trap into another pen.—Subscriber, Moneta.

I have mailed you bulletins containing description and plans of several trapnests. Any of these could be used,

I think, for letting the hens into an adjoining pen, merely by placing them against the partition and putting a wire door in place of the solid board at the farther end. The hen will naturally go toward the light. The usual method of keeping trapnest records is by keeping a card for each hen. She

HERCULES DYNAMITE

POULTRYMAN'S CALENDAR—APRIL, KEEP THEM GROWING

It is one thing to hatch a fine lot of chicks, and another to keep them growing. So many factors enter in—feed, exercise, cleanliness, room to grow in, chance to run, green feed, freedom from insect pests, fresh air—there is always a chance of failing somewhere and raising runts instead of vigorous layers.

With the coming of spring mites must be carefully guarded against. Nothing will kill chicks more quickly. The ration must be progressive, suited to the growing strength and capacity of the chick. Overheating must be guarded against. The sooner the chick can be gotten away from the stove and into the open, the better. Daytime heat must be reduced as rapidly as the weather will permit or the chicks will be weak and tender. The ideal life for a chick is that of a brood on range with a mother hen. The more nearly intensive conditions can be patterned after this the more vigorous will the chicks be. The run of the orchard is a wonderful help in pushing the chicks along and developing sturdy pullets.

friend are and what experience you have had and how much you will need to live on the next few years I could answer more easily. If you are young men, unencumbered with families, then you can do almost anything you want to do. If you are middle-aged men with families you will have to think longer before you tie up all available capital, for shoes and clothes do not grow on trees, and opportunities to earn money working for other people are not always to be had. If I had \$6,000 to start a poultry farm with I would put it all, and more if I could, into land, and then find a job that would keep the pot boiling and give me money to set out the land to suit. You can keep all the chickens you can take care of on from two to five acres but you won't have a great deal of room for fruit. With ten to 20 acres you can have both fruit and chickens and be pretty sure of an income whatever happens. Frankly, I cannot encourage anybody at this time to put \$6,000 into the poultry game. It is too uncertain. Eggs are selling for less than it costs to produce them, and prices have been too low all winter. Things may be better by fall, and again they may not. Put your money into land if you know anything about farming. Plant it to fruit or alfalfa. Put up a small chicken house. This summer or fall buy 50 pullets and see how you make out with them next winter. Some time in the fall order 500 chicks from the best breeder you can hear of. Order them for February and see if you can raise 150 pullets. If you succeed with them next year you might try 1,000 chicks. If you do not succeed you are not out a great deal. Make haste slowly is a

make the bones stronger, and sprouted oats and rolled oats help the development of the muscles.

Pullets Guaranteed

There has appeared at different times in your advertising section an ad offering young chicks and guaranteeing 90 per cent pullets. Can you tell me what experience any of your subscribers have had with this offering?—Subscriber, Paso Robles.

If any Cultivator subscriber wishes to answer this query his reply will be forwarded to Paso Robles subscriber. While I have no personal knowledge of the advertiser or his stock I see no reason why he should not guarantee 90 per cent pullets and come through with the goods. In the first place, "guarantee" does not, as I understand it, mean that he promises positively that there will be just 90 per cent pullets in the lot of chicks he sends, but that he is willing to make it 90 per cent if the number falls below. In the second place, it is well known among breeders that mating can be so controlled that the offspring will be nearly all pullets. This is done by mating an old cock with just as many pullets or very young hens as he can take care of and have the eggs reasonably fertile. It is not a question of picking out pullets after the chicks are hatched but of proper mating to produce the desired percentage of pullets.

Trapnests

I would like to get plans for the construction of trapnests, also the methods used and the manner of keeping

Cheap Power Is No Longer a Problem

In the OilPull the problem of producing cheapest power for farm work has been solved, by combining the Four Vital Factors. These are: (1) Lowest Fuel Cost. (2) Lowest Upkeep Expense. (3) Longest Life. (4) Reasonable Price.

In no other tractor will you find these four combined. As proof, the OilPull (1) has held all the principal National Fuel Economy records for 10 years. (2) Shows upkeep cost of only 50% of the Government's national average. (3) Averages 10 years and more of service. (4) Reasonable Price.

OIL PULL TRACTOR

"The Cheapest Farm Power"

OilPull success is due to many things, but of chief importance is TRIPLE HEAT CONTROL—a perfected system of oil burning that positively gets the power out of cheap kerosene, stove tops, distillate, etc.

Makes possible our unqualified guarantee to burn kerosene successfully under all conditions and at all loads up to its full rated brake horse power.

See the Advance-Rumely dealer for demonstration. Mail coupon for copy of our special booklet on TRIPLE HEAT CONTROL.

Advance-Rumely Thresher Co., Inc.
17-19 Main St., San Francisco, Cal.

Serviced from 30 Branch Offices and Warehouses. The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers, husker shredders and farm trucks.

Triple Heat Control

A gallon of cheap kerosene contains more actual power than a gallon of expensive gasoline. The problem is to get the hidden power out of cheap kerosene.

Triple Heat Control is a scientific system of oil burning that positively DOES get the power out.

HAY AND FEEDSTUFF
A. W. Scott Co. reports:
Receipts past week 1,186 tons as compared with 590 previous week. Heavy receipts, demand light. Government bids developed lower prices than during season, the main cause being competition of surrounding states reaching as far as Seattle. Export and coast shipping steady but very light. Alfalfa moving slowly but steadily. Demand from the south of the state keeps up and is diverting much that would come into this territory from Nevada. California stocks are moving more freely but generally for interior use and very little coming this way.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, March 29, 1922.
Prices are generally satisfactory. The \$8.00 mark is occasionally touched and many sales in auctions hold around \$7.00. Shipments to date exceed 10,000 carloads, which is only about 3,000 short of last year at same date.
Lemons are not commanding so much money but the few which are being offered are taken at fair prices. The lemon situation is affected by the large supply of foreign now being offered. There are around 125,000 boxes available for sale within the next 30 days.

Shipments
Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 10,050 cars; lemons, 2,852; total, 12,902. To same date last season: Oranges, 13,046; lemons, 2,768; total, 15,814. From Central California to date this season: Oranges, 4,244; lemons, 102; total, 4,346. To same date last season: Oranges, 4,334; lemons, 120; total, 4,454. From Northern California to date this season: Oranges, 372; lemons, 8; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.

POULTRY QUERIES

(Continued from Page 373)

must be legbanded, of course, and the number on the band placed on the card. The card is divided into squares, a square for every day in the month, and a mark placed in its proper square every day the hen lays.

STRAIGHT AHEAD

J. B. Lillard, state supervisor of agricultural instruction, in News Letter writes: "George Bernard Shaw is said to be responsible for the saying, 'If you can, do; if you can't, teach.' Someone in defense of the teacher and with a thrust at the destructive critic has retorted: 'If you can, do; if you can't, criticize.'"

More Money Assured Per Acre

Would you pay 11 cents for hogs and underfeed them?

Would you farm valuable land, go to the expense of plowing deep, selecting good seed, and then UNDERFEED THE CROP?

1922 gives promise, by reason of heavy rainfall, of being a year of heavy hay production, and prices are good. An increase of one ton per acre means an increase of from \$20 to \$35 crop yield per acre.

Pile on left shows alfalfa from plot not treated; pile on right, alfalfa from same size plot treated with only 200 pounds of gypsum to the acre. Photograph loaned by Prof. Olson of State Experiment Station of the State of Washington.

One of the MOST IMPORTANT ELEMENTS required by alfalfa is calcium sulfate. By applying it in the form of AGRI GYPSUM you supply just the material required to feed the leaves and tender growth. Actual plot tests on alfalfa and cover crops show increased yields of from 25 to 200% by using gypsum.

Wm. Sex. Rivera, writes: "The cover crop on the land where AGRI GYPSUM was used was from 3 to 6 tons heavier per acre."

Such crops as oranges, alfalfa, potatoes, hay, truck and crops with heavy foliage require LARGE AMOUNTS OF THE ELEMENTS CONTAINED IN AGRI GYPSUM.

You can reasonably expect from 25 to 500% increase in hay production by the application of 1000 pounds of AGRI GYPSUM per acre, at such small outlay that it is an exceedingly profitable investment.

Gypsum is of Value

THE general farmer is using more fertilizer and applying more of those materials which correct unsatisfactory soil conditions than ever before. At one time Californians said that manure is "poison" to California soil. They not only said it but they were honest in the belief and proceeded to haul thousands of loads of stable manure and spread it upon sandy roadways in order to subdue the dust and make the roads passable. Even California soils have proven their need of upbuilding, and no more manure is hauled to roadways but is, most carefully saved.

If an alfalfa field which will yield say five tons of good hay, by application of fertilizer or gypsum may have its production increased by a ton or two tons, or possibly five tons, the owner is making long money if his fertilizer investment is not too great. One of the best correctives for the soil of the alfalfa field is gypsum. Some have applied 500 pounds and others a ton or more and made great increase in alfalfa production.

The heavy clay or adobe soil met with so frequently in the Western states contains large quantities of iron, aluminum and magnesium silicates. These compounds in combination produce a weak natural cement. Such soils expand on wetting and shrink on drying out, thus creating surface cracks. This is called checking. Checking is very injurious to the plants. Roots are frequently broken when the surface soil cracks. It must be borne in mind, however, that this checking in a very modified or extremely slight degree is sometimes of benefit in permitting the light, air and water to circulate freely. Add gypsum to this type of soil and a peculiar chemical action takes place. The gypsum breaks up the combination of heavy clay compounds into simple substances. This makes the soil friable and open, mellow, allowing light, air and water to circulate freely, with consequent benefit to the crop.

Sandy soils are usually made up of partially decomposed granite or rock and are very porous in nature. When gypsum is added to sandy soil it plays an important part in further decomposing the granite or rock, and thus makes the soil more compact. Granite frequently contains considerable amounts of potash, which when released by gypsum becomes immediately available to the plant.

Gypsum, the soil standardizer, thus serves a variety of purposes in adding calcium and sulphate-sulphur, also in releasing potash to the soil for plant food, and of opening up or compacting the soil to the most ideal condition. Gypsum works on all soils, no matter how extreme their condition, and tends to produce a standard and ideal soil for agricultural purposes.

Owing to its chemical action when used as fertilizer, gypsum liberates potash and phosphate from the insoluble condition they are frequently in, and at the same time supplies the vital calcium and sulphate-sulphur to all plant life. By standardizing the soil it allows the light, air and water to circulate to best advantage. This is of great assistance to the plant and is necessary not only to plant life but to the favorable bacterial life in the soil.

These bacteria are of material benefit in rendering plant food available to the plant. Soil bacteria show greatest activity in a mellow soil well supplied with organic matter.

Soil bacteria are of considerable importance in connection with plant growth. The bacteria of greatest importance to the grower are classed under the head of "decomposition bacteria" and "constructive bacteria." There are four types of "decomposition bacteria" of primary importance to growers, namely, ammonifying bacteria, nitrifying bacteria, sulphofying bacteria, denitrifying bacteria.

THE NATIVE HOME OF THE CHERIMOYA

Wilson Popenoe, agricultural explorer of the United States department of agriculture, writing from Ecuador to the Journal of Heredity, says:

"The pineapple, the mangosteen, and the cherimoya," wrote the botanist Berthold Seemann, 'are considered the finest fruits in the world. I have tasted them in those localities in which they are supposed to attain their highest perfection—the pineapple in Guayaquil, the mangosteen in the Indian Archipelago, and the cherimoya on the slopes of the Andes—and if I were called upon to act the part of a Paris I would without hesitation assign the apple to the cherimoya. Its taste, indeed, surpasses that of every other fruit, and Haenke was 'quite right when he called it the masterpiece of nature.'

"This superb fruit (Annona cherimola), well known and highly appreciated from Mexico to Chile and Argentina, as well as in a few regions of the Old World, has received in recent years the attention of North American horticulturists. The climate of Southern Florida has proved too tropical for the production of good fruit (for the tree, though a native of the tropics, grows in those regions only at considerable elevations where the climate is much cooler than on the seacoast), but in Southern California excellent cherimoyas have been grown, and it is likely that in future years fruits produced there will make their appearance in the markets of the Eastern United States.

"The situations in which the trees are most commonly found, so far as I have observed, are the slopes or sides of small ravines and the occasional bits of alluvial land which are formed in the narrow mountain valleys. The valley soils seem to be preferred by the cherimoya, and such lands also appear to produce the largest trees, nevertheless it is not rare to find scattered specimens on clay slopes of somewhat rocky character. The climate of this part of Ecuador is warm, as indicated by the elevation, yet it is not hot as it is in the coastal lowlands. Sugar cane is cultivated, although not extensively, and around the occasional huts of the natives there are orange and avocado trees, bananas, and a few food crops such as corn and yuca (Manihot utilisima). The climate is less moist than that of Loja. There is a dry season, rather severe, I imagine, which extends from May or June to October or November.

"Cherimoya trees here reach 25 feet in height, occasionally 30 feet or slightly more. Often they divide at the ground and have three or four main stems. Only a few ripe fruits were available at the time of my visit, but there was an abundance of immature ones. I was interested to see if the various types which we recognize in cultivation, accordingly as the surface is smooth or rough, were to be found upon the wild trees. They were. In the numerous specimens examined the surface was most commonly smooth, with the carpellary areas marked by raised lines, but there were also, in limited numbers, most of the other types with which we are familiar in California."

SPRAY

HELP NATURE TO GROW HER FINEST

There is no market for knotty fruit and wormy apples. You will find just the spraying appliance you need in our famous line of

OSPRAYMO

High Power SPRAYERS

The result of 40 years of sprayer making. An Ospraymo Sprayer assures you of high power, and high power makes your spraying job effective.

Handsome Is and Handsome Does

Hogs are picking up, in fact this one is caught in the act. As Frost would say, "She is some hawg." This is a picture of the grand champion sow at state and other fairs in California in 1920 and at other fairs since, especially at the American Berkshire Congress at Riverside, 1922, where she again took highest honors. She was raised by Humphrey. Her name is Grape Wild Rose 6th, and she is now owned by the Italian Vineyard Company. She is the type of Berkshire now rapidly coming to the front.

Agricultural News Notes of the Pacific Coast

Northern California

J. W. Myers of Colusa shipped a carload of honey to New York March 16.

The farm center hall at Knightsen, Contra Costa County, has been dedicated.

Cling peaches were planted on 873 acres in Sutter County during February.

Shipments of beef cattle are being made from Surprise Valley, Modoc County.

Hunt Bros.' cannery at Hayward, Alameda County, has started on spinach.

Butte County supervisors are discussing hiring an official coyote hunter and trapper.

Work will soon start on the plant of the California Prune and Apricot Growers at Colusa.

Reseeding and protection of the ranges in Shasta County are planned by the farm bureau.

Large quantities of squirrel poison are being spread in Tehama County by farm bureau members.

The Rice Growers' Association recently made sale of 29,000 bags of rice at \$2.60 per hundred for No. 1 paddy.

Santa Clara County's Blossom Festival at Saratoga was opened last Saturday with address by Governor Stephens.

Reported offer of \$75 a ton for all wine grapes of the Cloverdale district has been turned down by the growers' association.

A migratory school is maintained in Orwood district of the delta region of Contra Costa County for children of asparagus pickers.

A. E. Bottel is the new horticultural commissioner for Riverside County. Mr. Bottel was inspector in Los Angeles County for five years.

Glenn County farm bureau meetings: Directors, April 8; Codora, 10; Orland, 12; Jacinto, 14; Willows, 17; Capay, 19; Plaza, 21; Grapevine, 26; Glenn, 28.

Construction on the road into Lassen national park from the Red Bluff-Susanville highway will probably not start till June 1 because of heavy snowfalls.

A large shipment of No. 1 paddy of the 1921 crop was recently sent from Yuba City. Sale was made outside the association but at \$2.60, the price secured through the association's activities.

Farm home department meetings in Tehama County: Antelope, 10 and 11; Corning, 12; Oak Park, 13; Henleyville, 14; Red Bank, 24; Bowman, 25; Squaw Hill, 26; Flounoy, 27; Red Bank-Reeds Creek, 28.

Grazing along Squaw Creek in the Shasta national forest will be cut 20 per cent because of overstocking last year. Supervisor Hall talked over the situation with stockmen at a meeting in Redding last week.

A survey of the poultry industry of Alameda County is planned by the farm bureau and the Hayward chamber of commerce with the idea of securing an outlet for surplus in making of salad dressings, potted chicken, etc.

Tehama County farm center meetings: Johnson-Reeds Creek, April 10; Dairyville, 12; Antelope, 13; Oak Park, 14; El Camino, 17; Red Bank, 19; Bend, 21; Richfield, 24; Stanford, 26; Liberal, 27; Flounoy, 28; Bowman, 29.

Central California

The San Benito-Santa Clara Cow Testing Association has 32 members, owning 1200 cows.

Poultry raisers of Inyokern have formed a cooperative association for purchase of supplies and marketing.

Twenty-five cities of the San Joaquin Valley have entered floats in the Raisin Day parade at Fresno, April 27.

Because of the cold season spinach packing at the Hume cannery at Turlock will not start till the middle of the month.

F. B. Roberts of Madera has been chosen by olive growers of that section to represent them at the Fresno organization meeting.

A. J. Flebut of the United States department of agriculture is making plans for experiments in control of citrus thrips with nico dust.

The Inyokern farm center has built a new road into Inyokern from the west, which will shorten the old route six miles. The new road is 22 miles long.

Contracts have been made for growing of 150 acres of cucumbers at Turlock. The Turlock Merchants & Growers Association will undertake the brining.

Cantaloupe acreage at Turlock this year is expected to be about 3,000, somewhat less than last year. Several growers will change to watermelons this season.

San Jose chamber of commerce has presented petition to the state highway commission that the Skyline boulevard be constructed as originally surveyed along the crest.

The Le Grand Elevator Association, one of the cooperative organizations of farmers in Merced County, is making arrangements for its fourth consecutive year of handling grain in bulk.

It is hoped that a state olive growers association will be formed by mid-summer so that it may handle this year's crop. Organization meetings are planned in all olive growing sections of the state.

Cotton gin built at Shafter, Kern County, by the cotton raisers association has been ordered sold to satisfy creditors. The growers organized in 1920 and were caught by the slump in the cotton market.

Additional payments of 3 cents on Muscats and Thompsons, 2 cents on Malagas and Feherzagos and 3 to 4 cents on dipped and bleached Thompsons to growers of Sun-Maid raisins distributed last Saturday.

Farm center meetings in Kern County: Delano, April 10; Wasco, 12; Rio Bravo, 13; Edison-Fairfax, 14; Mountain View, 17; Pond, 19; Inyokern, 20; Rosedale, 21; Shafter, 24; Arvin, 28; directors, Bakersfield, 29.

The federal power commission has given permission to the San Joaquin Light & Power Corporation to build hydraulic power plant on north and west forks of Kings River. 250,000 horsepower is to be developed at expenditure of \$50,000,000.

A horse and mule department has been organized in the Kings County farm bureau. The program includes a stallion and jack survey of the county, staging a horse and mule show at the county fair with educational features, the establishment of a horse and mule exchange also being proposed.

Southern California

Apricot growers of Ventura County will meet at Santa Paula, April 15.

Imperial Valley Iceberg lettuce sold last week in New York at \$7.50 per crate.

Imperial Valley reports activity by livestock buyers, an unusually large number now operating.

Imperial County fair directors have decided that no games of chance will be permitted on the fair grounds.

Victor Valley, San Bernardino County, is rejoicing in a season's rainfall of 15 inches. The average is six inches.

The Escondido, San Diego County, Citrus Union expects to ship 100 cars of lemons and 40 of oranges this season.

Mass meetings will be held in Los Angeles County through April and May to discuss the proposed state water power act.

Highway police are enforcing the 20,000-pound truck loading regulation over the Rincon causeway between Ventura and Santa Barbara.

County Bee Inspector Hanson of San Diego reports apiaries in healthy condition, only a few mild cases of European foul brood being found.

The first shipment of mohair, 26 bales, from Escondido Valley of San Diego County, was sent out by the Red Ribbon Ranch last week.

Manager Churchill says the Lima Bean Growers Association is retaining a quantity of limas in warehouse to be used for reseeding in case of late rains.

Alfalfa growers of Imperial Valley are now forming a marketing organization. Warehouses will be provided so that hay may be stored for favorable marketing.

The Auto Club of Southern California is calling on municipalities, boy scouts and school children to aid in keeping roads clean of broken glass and other "puncture material."

The Orange County Citrus Exchange for its ten months shipping season ending October, 1921, sent out 3539 carloads, 2530 Valencia's, 839 lemons, 140 Navels, 30 miscellaneous; returns f. o. b. California, \$5,973,165.04.

Imperial Valley date growers are planning to ship their own dates this season. At a meeting in Brawley, March 31, the methods of the Coachella Valley association were reviewed by the committee appointed to make investigation.

The state railroad commission has denied applications of two large transport companies to put on a line of motor trucks over the coast route between San Francisco and Los Angeles because "the present railroad, boat, and stage facilities are ample."

Farm bureau meetings in Los Angeles County at West Covina, April 10; Roscoe, 11; La Canada, 13; Covina, 14; Pasadena, 18; Rivera, 19; Hansen Heights, 21; Baldwin Park, 25; Owensmouth, 27; Pomona, all day at Ganesha Park, 28; Downey, May 1.

Horticultural Commissioner Ryan of Los Angeles County says that 1369 cars of oranges, chiefly Navels, have been inspected and shipped from January 21 to March 25 by the 80 packing houses in Los Angeles County. Upwards of 300 cars of Navels remain to be shipped during April. Thirty-one houses are now operating on Navels.

The Coast and General

Arizona livestock is wintering well; pastures benefited by recent snows.

Rains have delayed planting in Mississippi, Georgia, Tennessee and Virginia.

Portland, Oregon, stockyards report half their hog shipments come from South Dakota.

Vegetable growers of Idaho will this year market through the California Vegetable Union.

A unit of the Pacific Cooperative Poultry Producers has been organized at Eugene, Oregon.

The Colorado River Commission has been holding hearings in Salt Lake City the past week.

Plantings of head lettuce have been made by a number of farmers of Washington County, Idaho.

There will be a feeders meet and round-up at the experiment station at Union, Oregon, April 13-14.

It is estimated that 60,000 acres in Salt River Valley, Arizona, will be planted to cotton this season.

Practically all of the remaining 1921 crop of hops in the Dallas district of Oregon has been shipped to England.

The Ninth National Foreign Trade Convention will be held in Philadelphia, May 10-12. "Greater prosperity through greater foreign trade" is the slogan of the convention.

Farmers of Maricopa County, Arizona, will increase plantings of cotton, wheat, hay and truck crops over last season's. Total acreage planted in county is estimated at 300,000.

Colorado has an additional grade for potatoes to be known as Colorado Grade Standard. Two-thirds of the potatoes shall meet requirements of U. S. Grade No. 1, one-third, same as to size but quality as in No. 2.

Reports to the International Institute of Agriculture show practically same area sown to winter grains as last year in Belgium, Bulgaria, Spain, Finland, France, Poland, Roumania, Canada, United States, British India, Tunis and Algeria.

Stocks of wheat in country mills and elevators, March 1, are estimated at 72,564,000 bushels by the United States department of agriculture. This is the smallest quantity reported to the department for that date during the past ten years with the exception of 1918.

Stocks of potatoes in the hands of farmers and local dealers March 1 in the 15 leading potato states are estimated at 90,946,000 bushels by the United States department of agriculture. Of this quantity 73,486,000 bushels were held by farmers and 17,460,000 bushels by local dealers.

Homer A. Harris, who has had charge of the federal government's marketing bureau at Idaho Falls for several months, will close the office and go to Los Angeles, where he takes a similar position with a larger territory. It is expected the office at Idaho Falls will be reopened next fall.

What is claimed to be the first carload shipment of eggs from southwestern Idaho was made March 7 and 8, when two full carloads were sent out by the Pacific Cooperative Poultry Producers' Association. The shipments totaled 33,180 dozen eggs. One carload went to Butte and the other to Wallace, Idaho.

STOP right there, Professor! You say the success or failure of the tractor depends upon the operator? What is a good operator?" This question was asked by a worried looking young man who is responsible for the management of a large ranch in Northern California. He had asked a real question.

"You know the answer as well as I. There is little doubt but what the best operator for you to have for the many tractors on your large ranch is a man who is absolutely dependable, who will follow directions and not require repeated orders to do or not to do certain things about the machine, a man who is not a 'self confessed' master mechanic, but rather one who has had a good training in the use of farming tools and knows when he is doing a good job of plowing or disking.

"Of course, he should know enough about the machine to start the motor and do such necessary mechanical jobs as locating and remedying a missing spark plug, be able to adjust a carbureter, clutch or fan belt properly, but first and foremost he should be impressed with the fact that his job is to keep her rolling. I say this mainly because I know that you have a good mechanic and well equipped machine shop on your ranch. This mechanic is supposed to keep in touch with the tractors and other machines and be able to detect by inspection or listening when they are not working properly. He is also responsible for the repair work."

The other day a man who has always been enthusiastic about the use of tractors came into my office and placed a circular on my desk. It advertised the sale of a considerable portion of his high priced power farming equipment. "What's the matter?" His reply was the same old story. "It's like hiring a tramp to care for a thoroughbred race horse and expect him to win every race. We have used high priced equipment since our training in other engineering lines has

The Tractor's Better Half

By L. J. Fletcher, Division of Agricultural Engineering, University of California

shown that it pays to use the best of construction, but we are almost disheartened by the lazy, careless, brainless class of operators upon whom we must depend. When we do find a good man he will operate the machine for one, or maybe two seasons, do a remarkably large amount of work with few delays and low expense, and then he graduates into a service man or tractor or automobile repair mechanic. One year we hired factory men and paid them high wages. That year our repair bills were fairly low, but we could not make the men see that they were hired to operate and not to repair the tractors. Those men would not think of going on the job without a complete set of tools, and toward the end of the season I almost believed that I saw tractors start to come apart of their own accord when one of these men came near it."

The tractor pays its owner when it is working. Large ranch companies tried various schemes to prevent the expensive loss of time, for when a tractor is not running there is more than one expense piling up; first, the work is not being done, second, it generally means that money must be spent on the tractor, and, third, if a special mechanic is employed the tractor operator is not kept busy. Several companies have been successful with the bonus system. They have found that where the tractor will run for seven hours of the day it will "break even." The extra one, two or three hours of work per shift is where the profit is made. For that reason operators are paid double, or even triple, wages for all operation over seven hours. Another company pays operators on a double scale, one

rate for the time that the tractor is actually running and half this when they are repairing the tractor or it is laid up for repairs. Some of the large ranchers are trying out the use of a number of smaller machines in an attempt to get away from the serious delay of rush work when one large machine is laid up. One rather keen farm manager has adopted the principle of pushing the tractors through for one season's work, giving them careful attention as far as lubrication and care and operation are concerned, but by no means putting them through the often disastrous general overhauling. At the end of the year of 1,000 to 2,000 hours of work the machine is cleaned up and turned in on a new one. If this were generally practiced, it would make the problem of the used tractor even more serious than it is now with the dealer.

But how about the smaller ranches where the owner operates his own machine and there is but one tractor on the ranch? By far the majority of tractors in California are operated under these conditions, and if the ranch justifies the purchase of a tractor, and where the proper size and type of tractor and implements are used, they are proving almost universally a success. Studies made by the government in many of the Middle Western states where tractors are almost universally operated by owners show that the average annual cost of repairs does not exceed three per cent of the first cost of the machine, and this average is not on the first year's use, but extends through an average of 38 months. No one but an owner or one financially interested will give the tractor the kind of care

it really deserves. Most examples of the greatest economy of operation have brought out the following facts: First, the owner has carefully studied the instruction book or manual which came with the tractor and understands quite well the operation or duties of the various parts of the machine. He has no secret formula for his low operating cost except that he has followed directions and used common sense. He has changed the oil as often as required, been careful that all lubricants were clean and properly applied, kept all parts of the machine in proper adjustment, did not overload, jerk, or otherwise mistreat the tractor, and perhaps even went so far as to provide a waterproof shed or building for the tractor during the wet weather.

During this period of the nation's readjustment certain interests not entirely friendly to the use of the tractor are pointing out that it has had its day and enjoyed its spree when prices were high but must now give way to the old, time proven methods. The more or less general belief that there is a large difference in the construction, materials and resulting efficiency in various tractors of the same make and model is entirely unfounded. A rather careful study of the weaknesses of a number of the later tractors that have been put on the market has shown that these same weaknesses occur in many tractors of this design, but that there is something peculiar about one individual machine which makes it a sort of super tractor while many others made in the same factory at the same time are destined to be failures is not a fact.

In a comparatively short time anyone interested can find cases where all the more commonly sold tractors in California are proving a success from every standpoint. It cannot be proved that the machine is the variable, and it can be shown that the operator is the variable. For that reason we can be reasonably sure that as tractor operators improve in efficiency the use of the tractor will become more and more general.

The Alfalfa Catechism

By G. W. Hendry, University Farm

AT what season should alfalfa be planted?

A. Plant during February or March on land which has been fall or winter plowed and finely prepared just prior to planting. The mild cool weather of early spring with an occasional shower is the most favorable season to start alfalfa.

Q. Does fall planting give as good results as spring planting?

A. It seldom does in the north and the stand is generally damaged by weeds, frost or standing water. Last season (1921) February planted alfalfa at Davis gave four and one-half tons of clean hay per acre in three cuttings, also a light early clipping which contained some weeds.

Q. Do you recommend the use of nurse crops for alfalfa plantings in California?

A. Not under average conditions. The only situations in which they are recommended are those in which killing frosts occur soon after planting.

Q. How do you prepare the land for planting?

A. As fine and deep as possible, well settled, with moisture right at the surface. To accomplish this fall or winter plow deep, leave rough exposed to rain and frost, and harrow to a finely pulverized seed bed in February or March. Spring plowing just before planting is not so good and should be followed by disking, rolling, harrowing and floating to settle and pulverize.

Q. How late in the spring may alfalfa be planted?

A. Plantings after May 15 are often damaged by hot weather and drying and caking of the soil. June plantings at Davis have invariably given poor stands. It is necessary to irrigate to keep alive and the soil crust resulting from irrigation is injurious to the stand.

Q. How late in the fall may alfalfa be planted?

A. Alfalfa may be planted as late as December 1 and we have obtained a fair stand at Davis from January

plantings, but for good results planting should not be attempted after November 1 and then only on land which has been summer fallowed. Fall planting in the south is much more satisfactory than in the north of California.

Q. How much seed should be planted per acre?

A. If the seed is good and the soil moist and finely prepared 15 pounds drilled is about right. If you broadcast use 25 pounds, and if the land is cloddy or dry save your seed and plant it right next season. One pound of alfalfa seed per acre (220,000 seeds) means six seeds per square foot, ten pounds 60 seeds per square foot and 15 pounds 90 seeds per square foot. If you fail with 15 pounds of seed you would do no better with 40.

Q. How should alfalfa be planted and managed in the Imperial Valley?

A. In that section it is necessary to irrigate first and then prepare a seed

bed by plowing and harrowing. The seed should be planted from October to November. Irrigations after planting should be delayed until after the third or fourth leaf stage in order to avoid covering the seedlings with sediment. Two irrigations should be given between cuttings. On account of the long season five to eight cuttings may be obtained. Winter renovation is especially recommended in the Imperial Valley to break up silt deposits.

Q. How can alfalfa seed be tested?

A. The best way is to send a two ounce sample to Seed Testing Laboratory, State Department of Agriculture, Sacramento, and ask for a germination and purity test. This is done without charge, and by sending in several samples obtained from different dealers you can find which is the best and cleanest and protect yourself against planting dodder or "hard" seed.

Q. Is there much poor alfalfa seed on the market?

A. Yes, and you cannot always dis-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fall to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Hogs are picking up. The market is receiving them at a price which permits the grower to pay for their feed and have a bit of profit left. That is possible if the right type of hog is raised, one which will turn the minimum of feed into the maximum of flesh. An ideal is offered in the illustration on the cover.

* * *

There is now a National Retailers Association. The members of this association have become somewhat alarmed because of retailers being charged with demanding undue profits in these times of reconstruction. We believe this charge is not true to the extent to which it was a few months ago. The butcher, for instance, was quick to put the reconstruction price on livestock as he bought it from the farmer but desperately slow in scaling his price to the consumer. This resulted in injustice to both farmer and consumer and ultimately in reduced consumption. The high price sometimes maintained resulted in an order going past the home store-

keeper to other shrewd merchants who appreciated the conditions of the times. The Cultivator has had much of sympathy for the small town merchant. We believe so far as possible one's home merchant should supply the needs of the farm. If he will be content with a reasonable profit the farmer should patronize him. The merchant will then support the schools, the churches, the clubs and other institutions and make a more attractive home center.

VALUABLE REPORT

Numbers 11 and 12 of Vol. X of Monthly Bulletin of the California Department of Agriculture is invaluable to every one who wishes to be informed as to agricultural California. It is a book of over 200 pages and has Director Hecke's annual report, likewise that of the head of every bureau or division of the department which is becoming an institution of which every Californian is proud. We presume any citizen of California may secure a copy by writing Department of Agriculture, 11th and K Streets, Sacramento.

MORE ORCHARD HEATERS

The January freeze proved several things and one in particular—"orchard heating pays." The tall stack with "perfect combustion" was a bitter disappointment. It delivers the heat to the sky and not to the orchard—or did this year. Atmospheric conditions change fearfully and every "cold spell" is different. But the heater which will deliver its heat lower must come back.

All the lessons of frost fighting are not yet learned. Investigation is bringing them out, but in protected blocks—where growers cooperated—a 98 per cent delivery of fruit is secured whereas nearby orchards with similar conditions show a 30 per cent delivery.

GOOD READING

The editorial department sometimes grumbles because of the encroachment of advertising. Even occasionally a subscriber will write in and voice complaint because of the proportion of reading matter to advertising in a certain issue being below normal. But this complaint was far more frequent some years ago than it is today. We believe this is largely due to the improvement in advertising "copy." Some of the best artists and some of the best writers of the land have been secured to present the merits of advertised articles. These men have made a thorough study of their work and have learned the general principles such as truthfulness, attractiveness, illustrations, general information and optimism.

Lest our readers may possibly feel the need of more reading matter we are going to suggest that this issue and the next and even the following afford the opportunity of securing a line of wonderfully helpful information through the advertising columns. For instance, take the ad (we may add that the word ad is short for advertisement, and note that it is a word and not an abbreviation) on page 390. It touches upon "Prunes for the health that's in them" and the suggestion that they are good for Monday, Tuesday and on till Sunday. Then this helpful suggestion:

"Prunes are a natural corrective. Nature has seen to that. Moreover, these natural sweetmeats can be pre-

pared in so many ways that there is always a new dish to tempt your table-folk."

Then bear in mind it is the California farmer who is giving to other farmers through the Cultivator valuable information. There is no section in the world where farmers are spending hundreds of thousands of dollars for advertising their products as in California.

Then the little girl on the opposite page with her alphabet blocks a yard high is passing on to the 40,000 homes into which the Cultivator goes, a most valuable suggestion as to the height of the sink her mama should have. There are a little over two dozen words in that full page advertisement, but a lesson invaluable is conveyed. The height of a sink makes a world of difference to the tired back of one who is working over it much of every day. We know of a home in which only a week or two ago a material change in plumbing, costing over a hundred dollars, was made because for years a sink altogether too low had caused backache and even heartache. Because of the knowledge we have of that incident we would suggest that in determining on plumbing installation, the tallness or otherwise of the one who will spend much of her life before the sink, be taken into consideration. But that is not the only helpful suggestion in that advertisement. Study it.

In another ad is a statement that in 1910 "we paid \$33.90 for a certain size of tire. Today, for a vastly better tire of the same type, you pay \$10.95." Therein is both economy and optimism. Then there are statements that "your battery must have proper care," that "an automobile may be faithful, powerful and enduring," that a tractor may be "automatically lubricated," and again some of the best lessons are obtained from the ads appearing in the livestock department, "the bull is half the herd"—possibly the better half, and many a one is offered for sale. There are records of production and records of winnings which should inspire every livestock breeder to most careful discrimination in making purchases for his own herd. Advertisements are inspiring and make most profitable reading for the farmer.

STEERING FROM POLITICS

A Redlands subscriber writes: "I have been taking and paying for the Cultivator for several years. You no doubt are operating this paper for profit first and for the general good of the rural population second. You are steering pretty effectually from political questions. I do not see you taking much of a stand against single tax or the proposed amendment authorizing the machine to start on the issue of a five hundred million dollar bond issue to ostensibly buy up most or many of the public utilities of the state. The King bill got no objection from your paper as I remember. We need some reductions in taxes rather than continual increases."

As to "operating for profit first and general good of the rural population second" will say that the Cultivator has a reasonably good hunch that unless it hews fairly close to the line of "general good" the "profit" will be materially like the core of the small boy's apple—"There won't be no core." To the best of our judgment the general good will come by standing squarely and emphatically against the single tax, and the single tax has been a proposition before voters of California as regularly as the biennium comes around. It was before the voters at the general election in No-

vember, 1920. At that time a single taxer having complaint of our attitude opposing the single tax wrote us an amongst his reasons for upholding the single tax was this: "Land was not produced by man, it was created by God. It was not made for certain people but for the human race to make a living from." To this we replied on the editorial page of October 30, 1920, as follows:

"As to the Creator we grant the claim of our subscriber, but we also recall that the Sweet Singer of Israel at one time remarked regarding the man who fears the Lord: 'His seed shall inherit the earth.' Inheritance has been passed on from father to son ever since that song was sung and to begin today to declare that inheritance invalid, to destroy our love of our own homes because of a claim that all the earth should be possessed in common appeals to us as not only unwise but unpatriotic. We believe the strongest incentive to love of our country comes from the fact that our country stands for the protection, the very preservation of our home life. The present tendency in this state is toward creating a greater number of small home farms. The truest American citizenship is developed in such homes."

"The farming lands already have great enough burden to bear without taking the entire burden of taxation. The census has shown the drift to the cities (where most of the person's property is possessed), to be increasing every decade. Why drive a people into the same effort to secure more stocks or bonds or personal property wealth?"

The Cultivator is just as emphatic as ever as to the awful injustice which the farmer will suffer if the single tax is foisted upon him. We will work and vote to the end that the single tax measure be defeated.

As to California's Water and Power Act we will work and vote for it. The farmers of the state, so far as the have taken action or passed resolutions, have favored it because they see in it the retaining for the people of their own power at cost. Hydroelectric companies, which have hopes of their ability to secure these great privileges for personal profit, have promised investors in their bonds a preferred stock even above 8 per cent return on money invested. We can see no justice in burdening the farmers with high rates for the use of power to lift water to irrigate their lands in order to pay high interest rates to investors in hydroelectric securities; neither to pay high salaries to a very few executive officers. The state and municipalities and even our cooperative marketing organization have succeeded in hiring the best of executives at lower salaries than are often paid by the utility corporations. In other words, the five hundred million dollar bond complained of by our Redlands subscriber can be floated at a vastly lower rate of interest by us the people of California, than it can be by corporations. The water and the power are our own. Let us add them to the lands which we also own. The most rapidly growing city in the world today affords proof of the value to the people of retaining possession of their own. As to buying public utilities already established we hope it will not be necessary. It will not be if the corporations can deliver the goods at a reasonable price. If, however, the state can secure better results for less money we can see no valid reason why the people should not take charge and reduce distribution costs. It has been done in Ontario, Canada. It has been done in the city of Los Angeles.

The King bill got no objection from this paper. It did get fullest support simply on the ground that the farmer has always borne the burden of taxation. The King bill provided that the burden of taxation should not be returned to the farms.

The Central Livestock Market

THE Central Marketing Plan carried out in the livestock and agricultural sections of the United States, except in California, and as now proposed for Los Angeles means:

Facilities

Modern pens and buildings with facilities for feeding, resting, weighing, sorting and otherwise caring for and handling meat food animals, also horses and mules. The plant should be sufficient to provide a place where at any time a reasonable quantity of livestock may be housed and yarded while awaiting sale or while stopping in transit for feed and rest; also to provide facilities for branding, dipping and dehorning of cattle.

The Market

The place where the buyer and seller may meet instead of traveling around the country searching for what both want. The place where a cash market is maintained every business day in the year for the buying and selling of all kinds of food animals under competitive bidding from the greatest number of buyers. The place to work out plans for better grading of livestock generally, to improve the grades and quality and increase quantity by cooperation between producer, packer and federal, state and county representatives.

Marketing

The purchase and sale of food animals may be in any one of three ways: by the owner, cooperative institution, or so-called commission firm. The choice is entirely with the owner.

Humane Handling

One of the principal features of the market is to compel humane handling of food animals to avoid bruises and other injurious things which result in loss of meat food product.

Railroad Facilities

To provide an organization to specialize on railroad rates and service, and working for better loading and unloading facilities, to avoid bruises and other damaging things connected with the marketing of livestock.

The fat hog auction has saved California swine men. The cattlemen have faced serious difficulties and until recently unsatisfactory market conditions. California has no large centralized market. The packer still goes to the ranch, which is satisfactory to large cattlemen but often means ruin to the business of the smaller producer. The chamber of commerce of Los Angeles is acting to secure a centralized market. Its action should result in advantage to the cattlemen. Its committee reports:

The Livestock Exchange

In connection with all livestock markets of any magnitude the so-called livestock exchange, consisting of traders and those immediately identified with the marketing feature of the exchange, makes rules and regulations for the orderly buying and selling and regulations for the handling of livestock at the market. The members of the exchange are in direct contact with the daily receipts of livestock and prices prevailing at the principal central markets of the country, and not only stand ready to serve the local buyer or seller but to execute orders for out-of-town buyers.

This direct contact with out-of-town markets furnishes a basis of value, and if the shipper does not desire to sell to a local buyer he knows what his stock is worth on other markets and may go on to such markets without undue penalty.

(The Exchange supporters can certainly take no exceptions to the foregoing two paragraphs. Possibly our readers may not, for it is a very fair statement of what an exchange ought to be. But the abuses which have crept into the great grain and other exchanges have resulted in congressional action—not yet entirely satisfactory—and the application of such epithets as "greatest gambling institution on earth." If, however, an exchange will perform its legitimate functions, welcome.—Ed.).

Federal Supervision

The market will be conducted under the supervision of the department of agriculture and operated under the provisions of the so-called stockyards and packing house act of 1921, which requires the licensing of all such markets, and also the buyers, for packing plants engaged in interstate commerce. All rates and charges of the marketing institution must be published and filed with the department of agriculture. All charges for services rendered must be kept in

accordance with prescribed methods and must be kept open for federal inspection. The act forbids unfair, unjustly discriminatory or deceptive practices or unreasonable preferences or advantage to any person or locality, also the transfer or exchange between packers of livestock purchases, or doing anything that will monopolize or control prices, etc.

Sources of Income

There are two principal sources of income: So-called yardage charges and sale of feed. The yardage charges cover all services in connection with yarding, weighing and delivery and are assessed only in case of sale. The charge is paid by the seller. No charge is made for trying the market or for feed and rest of transit shipments. The charge for feed covers also the service of feeding and watering at any time of the day or night.

Packing Plants

Within 25 miles of Los Angeles there are 33 slaughtering plants operating under federal and city inspection. Extend the line another 50 to 100 miles and we find many other plants of a similar character. The total number of animals slaughtered annually within the 25 mile circle is: Cattle and calves, 260,000; hogs, 270,000; sheep and lambs, 434,000 (almost 1,000,000 head—about three times the slaughter at Denver). An additional 200,000 animals are slaughtered within the larger circle.

The Supply

California supplies 40 to 45 per cent of the cattle and calves, 10 to 25 per cent of the hogs, and 50 per cent of the sheep. The remainder is obtained as follows: Each plant having a corps of buyers traveling the country as far north as Yellowstone Park, east to the Rocky Mountains and the Texas state line. Practically all of the present hog supply is now coming from western Nebraska and the panhandle

of Texas. A large part of the cattle supply comes from eastern central markets, and it is not unusual for the Idaho, Utah and Nevada producer to ship cattle to Denver, to be purchased there by California slaughterers.

Without attempting to estimate the loss of meat food by shrinkage, the freight bill for the unnecessary ride of more than 1200 miles from home to Denver and thence to California, as against, in many cases, the lesser distance to California, is an item of serious waste. Strange as it may seem, this thing occurs at the very time the California packers have an army of buyers in the section from which the movement first takes place.

Outside of the amount purchased on eastern central market, all purchases are made by a ranch to ranch canvass by each packer. This is an expensive process at the best, with the result that the packer selects the large producer where the greatest number may be had.

It costs just as much for railroad fare, hotel bill and wages to spend a day or two in buying 30 cattle as it costs to buy 300 cattle, and it takes about as much time to go over and cut out 30 cattle from a herd of 200 as it does to buy 300 already graded on the big ranch. That is the trouble today with the small rancher—he has not a chance against his larger neighbor. If he had a market he would either deliver to the market by truck and take home a feeder, or a country buyer would purchase a few head from each rancher and ship a carload to market.

The Hog Situation

The hog situation is even more serious. We have already observed that 75 to 90 per cent of the present supply comes from east of the Rockies and bought largely through organized markets. It is a matter of common knowledge that today pigs are being killed in California because of the lack of a home market. A substantial part of the supply of hog product is now being shipped into California from the East for processing.

(Continued on Page 393.)

Requirements for the Rabbit Business

By W. D. White

The rabbit business requires—the same as any other business—Grit, gumption and Grace:

Grit to stick to it, regular daily work; gumption to use for yourself the best of what you see or read; Grace to bear some backsets, for it has its ups and downs.

Have good hutches in as good a location as you can.

Get good foundation stock from reliable breeder.

Have good utensils and keep them clean.

Keep stock clean, out of hot sun or drafts and dry.

Follow line breeding and use only healthy stock.

Keep your records full and complete. When you sell buyers of stock want to know what is what and who is who.

Use only good and proper feeds; anything else works harm. Use your eyes and nose when buying.

Start in small way and increase as business demands.

Put a plain truthful ad in a re-

liable paper. Keep it there; you can sell all the good stock you can raise.

An itemized statement for 1921 from a rabbit raiser who works during the day and cares for his stock nights and mornings shows that he made

\$331.73 profit from his backyard proposition in rabbits during the year. Rabbit raising pays big dividends to him or her who works at it in the right way with good stock, given good care.

Veteran Goodyear users tell us that our tires today give more than twice the mileage they did ten years ago.

The average decrease in the price of Goodyear Tires since the year 1910 is more than sixty per cent.

QUALITY WAS NEVER SO HIGH PRICES WERE NEVER SO LOW

It is a favorite practice nowadays to refer more or less sagely to the good values of "before the war."

So far as tires are concerned, any such reference is an illusion.

The plain fact is, pre-war tire values were only a pale shadow alongside those of today.

Every tire in the Goodyear line proves this to be true.

If you are a veteran Goodyear user you have probably noticed that our tires today give more than twice the mileage they did ten years ago.

If you have compared the prices of then and now you have seen that

present Goodyear prices are less than half of what they were.

Just to make this clear, consider our 30 x 3½-inch Cross-Rib clincher.

In 1910, for example, you paid \$33.90 for this size tire.

Today, for a vastly better tire of the same type, you pay \$10.95!

All other Goodyear Tires show similarly important reductions, the average decrease in price since 1910 being more than sixty per cent.

Goodyear quality was never so high—Goodyear Tires are larger, heavier and more durable than ever before.

Goodyear prices were never so low—as the figures here listed will show.

30 x 3½ Cross-Rib Fabric.....	\$10.95	33 x 4 All-Weather Tread Cord.....	\$33.40
30 x 3½ All-Weather Tread Fabric.....	\$14.75	33 x 4½ All-Weather Tread Cord.....	\$42.85
30 x 3½ All-Weather Tread Cord.....	\$18.00	34 x 4½ All-Weather Tread Cord.....	\$43.90
32 x 3½ All-Weather Tread Cord.....	\$25.50	35 x 5 All-Weather Tread Cord.....	\$54.75
32 x 4 All-Weather Tread Cord.....	\$32.40

Get new 1922 Model STUMP PULLER

Clear your Stump Land without cost. Increase your income and the value of your farm. Your richest land lies under those tax-eating stumps. Pull them—make this valuable land work for you. Get a Stump Puller free by being a

Kirstin Demonstrator

Pay for your KIRSTIN by showing it to others on your own land. Our plan does not interfere with your own work. Thousands write us every year about the KIRSTIN. We want one owner in each locality who will let us send other people to his farm to see the KIRSTIN work. You don't sell or canvas—just show the KIRSTIN.

We Pay You Cash

The KIRSTIN Demonstrators earn cash commissions for this easy work. A few commissions pay for your own Puller and give you extra money besides. No limit to the money you can earn. **WRITE TODAY!** Act quick! Only one demonstrator appointed in each locality. Special low prices to demonstrators. Write for full details at once—today.

A. J. KIRSTIN COMPANY

4209 Lud St.
Escanaba, Mich.

THE ALFALFA CATECHISM

(Continued from Page 379.)

tinguish it by its appearance. We have tested many fine looking samples which germinated less than 50 per cent, the remainder being "hard" seed. Good seed, however, properly stored should retain its vitality for six years and shows a better germination several months after threshing than when fresh. Very old seed can generally be easily distinguished by their red brown color.

Q. How is alfalfa seed graded?

A. The specific gravity process is in general use and the machine is the same in principle as the one used for separating gold from crushed rock. It is also in general use in California for cleaning and grading light vegetable seed.

Q. Is dodder carried on the seed?

A. Dodder seed is closely related to alfalfa seed in appearance and when mixed with alfalfa requires an expert to detect it.

Q. Does it pay to drill the seed?

A. Yes. The drill properly handled insures a more uniform stand and requires less seed than the broadcaster.

Q. What do you mean by properly handled?

A. First, the drill must be of a type that will handle small seeds like alfalfa. Not all makes will do this. Secondly, the whole art of drilling alfalfa consists in planting shallow, not more than one-half inch in a pulverized, well settled soil which is moist to the surface. Only a few makes of grain drills can be set to plant at this shallow depth. If you broadcast, use a brush drag to cover—a peg tooth harrow buries the seed too deep.

Q. I have been advised to treat my seed with bacteria cultures before planting in order to inoculate the roots with nodule forming bacteria. Is this beneficial and does the university supply such material and directions for using it?

A. Most California soils are not in need of artificial inoculation as the necessary organisms are already abundantly present, and alfalfa seedlings quickly become thoroughly inoculated through natural processes. Inoculation is most easily accomplished by using dirt from a successful alfalfa field. The university does not distribute inoculation material, but a leaflet describing a simple home method for making cultures from soil taken from old alfalfa fields may be obtained upon request from the Agronomy Division, University Farm, Davis.

Q. I have an old alfalfa field in which the stand has become thin. How should I proceed to thicken up the stand?

A. If the stand is so thin that satisfactory yields are no longer obtained you had best plow the field next fall and reseed in February or March, or better grow barley, corn or beans for two or three years and then replant to alfalfa. Both the alfalfa and the other crops will be benefited by the rotation. If you are much in need of hay next spring, disk the field thoroughly this fall and drill 70 to 80 pounds of Red oats or Chevalier barley during November or December. Sudan grass drilled in May is not so good. It is generally a waste of effort to attempt to improve the stand by sowing alfalfa seed among the old plants.

Q. What is considered a good yield of alfalfa seed and how is the seed crop harvested?

A. Fifteen hundred pounds of clean seed per acre is a high yield and the average is from 100 to 400 pounds of seed per acre. The crop may be cut when the pods are ripe and the seed hard, with a self rake reaper or mowed, windrowed and threshed with a grain separator with seed attachments, but a regulation clover huller is to be preferred. It is customary in California to cut one crop and let the second crop make seed. Nine to 12 weeks will mature a crop. Seed may be produced any place in California that alfalfa thrives, but the moisture supply should be reduced during the ripening of the seed and the drier,

warmer climates are preferred. Old fields with thin stands produce better seed than young crowded stands. Planting in rows for seed production is sometimes practiced. It costs about five cents per pound to thresh and clean the seed. The straw remaining after threshing has some feeding value.

Q. Why is alfalfa seed grown in California and the western states in larger quantities than in the East?

A. Because the climate is more favorable for producing high quality seed and better yields are obtained. In humid climates alfalfa sends up shoots from the crown before the first crop of blossoms has been fully formed and this interferes with seed production. In interior California shoots do not develop from the crown, noticeably, until after irrigation. Rainless summers are best for alfalfa seed production. Dry summer heat is also an aid in "tripping" and pollination of the flowers.

Q. Do you advocate rolling alfalfa after planting?

A. Not always. The corrugated roller is beneficial in holding moisture up in soils which dry quickly and is generally the most efficient tool for breaking light crusts formed after planting.

Q. Do you believe in clipping back first year alfalfa when six or eight inches high to throw the strength into the root?

A. I believe in clipping young alfalfa to check rapid growing weeds which threaten to choke it out, but do not think that such treatment affects the crown or root development one way or the other. There is experimental evidence in support of this view.

Q. What have your experiments shown about Hairy Peruvian alfalfa?

A. Hairy Peruvian starts growth earlier in the spring than common alfalfa and continues to grow later in the fall and produces a slightly heavier tonnage. The stems are coarser the leaves larger and hairier and the quality of hay inferior to common alfalfa. The coarseness of Peruvian hay is especially marked in thin stands, on light soils and in overripe hay which becomes quite woody. On the whole the greater productiveness of Peruvian alfalfa does not compensate for its poorer quality and we are satisfied to use the common variety in our own fields. A plot of Hairy Peruvian alfalfa planted at Davis in 1919 now three years old, is 50 per cent dead. Smooth Peruvian adjoining is 25 per cent dead, common only 10 per cent dead, showing clearly the shorter life of Hairy Peruvian under the conditions of this test.

Q. Is there any variety of alfalfa which is more drought resistant than others?

A. There is no authentic experimental data which I know of to show that there is. Turkestan has had that reputation but Turkestan is merely a regional name applied to any seed imported from Turkestan and such importations have proven to be quite variable and almost always inferior to American seed. Some dealers have claimed greater drought resistance for "dry land" seed produced in arid localities, but there is no reliable evidence in support of this contention.

Q. Can alfalfa be grown on adobe soil and is there any variety better adapted to such land?

A. Alfalfa does not thrive on stiff heavy soils and while it may hang on for a time it is seldom profitable. No difference in the adaptability of the several varieties for such soils has been observed.

Q. What variety is best for high elevations in Northern California?

A. Where the ground freezes and winter killing occurs any of the variegated alfalfas, such as Grimm, Baltic or Canadian, will succeed better than common alfalfa. You may obtain information regarding sources of seed of these varieties from Professor P. F. Trowbridge, Agricultural College, North Dakota.

Q. How much alkali will alfalfa stand?

A. Old established stands of alfalfa will tolerate some alkali, but the seedlings are sensitive and easily destroyed. It is best to plant alkali land during the winter while the alkali is down, so that the seedlings can become established and root deeply before the salt rises in the spring. On land containing as much as 0.2 per cent to 0.4 per cent of total soluble solids or from .05 to 0.1 per cent of

black alkali alfalfa may be established if properly managed, but it is an uncertain undertaking. After the stand is established, heavy top growth retards evaporation and checks concentration of salt at the surface. Alfalfa can endure seven to ten times as much sodium sulphate and four to five times as much chlorides as it can carbonate, but in general cannot be grown when alkali prevents the growth of barley. When there is but a trace of "black alkali" and the salts present are principally of the white form, alfalfa may be healthy when the concentration amounts to 0.5 per cent of the total dry weight of the soil, but when sodium carbonate or bicarbonate makes up the whole or a considerable portion of the soluble matter, as little as 0.1 per cent may be decidedly injurious.

Q. What causes the poor spots in alfalfa where no alkali is present?

A. These are often the result of poor soil preparation and may be knolls, which have been cut off in leveling and not replowed, and on which the soil is too hard for the penetration of alfalfa roots, or they may simply be high spots, which are not covered in irrigating. A gravel pocket underlying the surface and causing rapid drainage may also account for poor spots.

Q. How should alfalfa be irrigated the first season?

A. Irrigations should be withheld until seedlings start to turn color and show a decided need of water. This may be as late as June or July for February seedlings. The object is to encourage the seedlings to strike deeply into the soil in search of moisture.

Q. What depth of irrigation water is required to produce the best yields of alfalfa on medium soils in the Sacramento Valley?

A. About 35 inches, applied in seven inch installments, one after each cutting, or about three acre feet.

Q. What is the most desirable size of check and grade for alfalfa on soils of medium texture?

A. A convenient average check is one 40 feet wide and about 400 feet long, with a grade of from three to six inches per 100 feet, when about six cubic feet of water per second is used per check.

Q. What is meant by the renovation of old alfalfa stands, and what sort of tools are best for the purpose?

A. Renovation or winter cultivation is practiced to destroy weeds and aerate the soil. The disk, the spring tooth harrow and special spike tooth alfalfa renovators are all used. I prefer the spring tooth harrow crossing the field at right angles several times during February or March, while the soil is in a pulverizable condition and the young weeds easily destroyed. The disk is too destructive and cuts off too many crowns. The soil becomes very compact about alfalfa crowns through continuous irrigations, and the vigor and health of the plants is improved through this early spring cultivation.

Q. What is an average and maximum yield for alfalfa?

A. On deep, fertile, porous irrigated soils in the great valley of California, good young stands of alfalfa, properly managed, should yield 11 tons of cured hay in five cuttings. The average is nearer five tons to the acre.

Q. How can one judge at what time to cut alfalfa?

A. The most reliable indication to go by in California, after the first year, is to cut when the blossoms begin to appear. Eastern growers watch the new shoots from the crown and cut when these begin to put out, but this is not a reliable guide in California. It is injurious to cut alfalfa the first year until the tops have made a large growth and the crowns have formed.

Q. What is the profitable life of an alfalfa field?

A. Under ideal conditions, such as are found on some of the deep, sweet, well drained soils of interior California, well cared for fields of common alfalfa may endure for 30 years or longer, but yields generally decline after the fourth or fifth year. But generally gophers thin the stand to such an extent that it becomes unprofitable after ten years. An eight year old field was plowed at Davis in 1921 in which the tap root of every plant examined has been cut by a gopher from 3 to 22 inches below the crown, but in most cases the leader has been replaced by several smaller lateral roots which extended to a depth of

eight feet or more and the plants were still yielding well. On poorly drained soils, heavy textured soils, or in eastern climate ten years is about the maximum life period.

Q. Under favorable circumstances how deep will alfalfa roots penetrate?

A. The longest roots of common alfalfa reported to my knowledge were those described by Chas. W. Irish, chief of irrigation inquiry, U. S. D. A. as cited by Coburn. The roots were found penetrating crevices in the roof of a tunnel 129 feet below the surface of an alfalfa field. The average alfalfa root is under an inch in diameter and the length is largely determined by the depth of the water plane and the soil texture, but usually does not exceed fifteen feet in length. Stebler and Schroter cite Bonnet's record of a tap root 66 feet long.

Q. What is a good crop rotation, including alfalfa for a general stock farm under irrigation in the Sacramento Valley?

A. If you need silage and grain I would recommend the following as a thoroughly practical and well demon-

strated rotation: Alfalfa four to six years followed by barley followed by sorghum. Alfalfa to be fall plowed and seeded to barley November or December. Barley harvested in June and a quick maturing silage crop, such as Early Amber sorghum, may be taken from June to October, land fall plowed and planted to Yolo for grain or honey sorghum for silage, April 20 to May 1. Sorghum harvested in October, land fall plowed and reseeded to alfalfa February or March. This rotation has been followed with variation on the university farm. The rotation described is sometimes objected to on the contention that sorghum leaves the ground too rough for alfalfa seeding, but the difficulty may be overcome by proper disking of stubble and deep fall plowing.

Another alfalfa rotation now in effect on the quadrangle field at Davis is: Alfalfa six years plowed in winter—planted to Yolo May 1. Yolo harvested October 15, land thoroughly disked and drilled to Hard Federation wheat November 1, wheat harvested June 1, stubble disked in June and plowed in November and re-

planted to alfalfa February or March. This rotation leaves the ground in better condition for alfalfa drilling than the first described rotation.

Q. Is there any experimental evidence to support the theory that other crops yield better following alfalfa?

A. Yes. Schofield found that potatoes were increased in yield 100 bushels per acre, oats 6 hushel per acre, sugar beets 3.4 tons per acre following alfalfa. At Davis corn, barley and grain sorghums have yielded better following alfalfa.

About nine years ago we planted one check in a large field to Arabian alfalfa, the remainder to common alfalfa. In three years the Arabian had disappeared entirely and in six years from planting the entire field was plowed and planted to corn for silage. The check which had been in Arabian alfalfa and had remained bare for three years produced about twenty per cent less corn than the remainder of the field, which had been in common alfalfa continuously for six years preceding corn planting.

Q. Is it possible to market Cal-

Your Kind of Battery Needs Our Kind of Service

To get all the miles and months out of your battery it must have proper care from the very first day you put it in service.

That means having water put in at least twice a month, and seeing to it that the charge is kept up to the proper point.

Also to go straight to the nearest Battery Headquarters the minute you suspect your battery isn't up to the

mark. Each one of the names listed below is Battery Headquarters in its community, equipped and organized to give battery service according to the Willard Standards.

It makes no difference what make of car you drive, or what make of battery is on it. Willard Standards of Service provide for exactly the same care and attention to all batteries regardless of make or any other consideration.

All the dealers listed below give the Willard Standard of Service on all makes of Batteries:

THREADED RUBBER BATTERY

California grown alfalfa hay at a profit in the east?

A. The first eastern shipments in quantity of California grown alfalfa were made in October, 1921 when several cargoes of from 500 to 3,000 bales each reached the eastern seaboard via the Panama canal. The new water rate which has made this outlet possible is \$12 per ton including canal tolls, but exclusive of distribution charges at point of delivery. It was reported that California alfalfa because of its good odor and quality brought a premium over eastern alfalfa of \$4 to \$5 per ton.

OLIVE GROWERS IN EARNEST

Olive growers in all parts of the state are getting together to form a marketing organization in time to handle this year's crop. The Fresno chamber of commerce set aside \$500 for organization expenses. T. B. Mc-

Kelvey, chairman of the committee on organization, has been sending out letters to olive growers and others interested, outlining the contemplated plan of organization.

It is hoped that olive growers of the state will nominate representative successful growers from different olive growing sections, who will attend a meeting in Fresno, April 30. A suggested plan of organization will be furnished each representative so that when he comes to Fresno he will be thoroughly informed and ready to make constructive suggestions. It is hoped that action may be secured promptly so that the state association may be incorporated by June 1.

For purposes of organization the state has been divided into three districts—one south of the Tehachapi, one between the Tehachapi and the Sacramento Valley, and one north of the Sacramento Valley. Each of these

districts is being asked to nominate 25 representative growers to act as trustees, to meet at Fresno on April 30 to adopt a plan of organization for the association, and to prepare a contract for the signatures of the growers.

ALMOND GROWERS WIN POINT AT WASHINGTON

Manager Tucker of the California Almond Growers' Exchange writes that advices have been received from Washington that the senate finance committee will recommend a tariff of five cents on almonds in the shell and 15 cents on shelled almonds in the permanent tariff bill.

He adds: "This is indeed a great victory which our California senators and representatives have won not only for the benefit of the 5,000 almond growers of the state but for California

generally as such a schedule of import duties on peasant grown almonds from Southern Europe means that the almond growing industry in California will thrive and expand to tremendous proportions. Eventually it will mean \$20,000,000 a year more poured into California business and development.

"As we see it there have been three elements in our tariff fight which has been carried on for nearly a year and a half. Those elements are the newspapers of the state, the California congressional delegation and the California Almond Growers' Exchange. The fight is not yet won. The tariff bill must yet be passed by the senate, adopted by the usual conference committee of house and senate and be signed by the president.

"As you know we are in the throes of a reorganization campaign at the present writing. Victory in the tariff fight ought to convince not only almond growers but all farmers that their future lies with their cooperatives. No speculator ever made an effort to advance the California farmers' interests as have his cooperatives. No interest or group of interests has advanced California as have the farmers' cooperatives, save the newspapers of the state. We feel that we are working with you in a great cause."

V. C. BRYANT TAKES UP WORK OF W. H. HEILEMAN

The executive committee of the state farm bureau federation announces appointment of V. C. Bryant to fill position left vacant by the death of W. H. Heileman, secretary of the state farm bureau federation. Mr. Bryant has been assistant professor of agricultural extension of the University of California and is thoroughly familiar with the work of the farm bureau.

Mr. Bryant's past experience and training fit him well for this responsible position. He was raised on an 320-acre ranch in central Kansas and served a thorough apprenticeship on a general diversified ranch on which corn and wheat were produced, steers and hogs were fed and a string of 25 to 30 of the best cows milked. After completing the work offered in the local schools he entered the State Agricultural College at Manhattan, Kansas, from which college he graduated in 1910, having majored in agronomy and taking all the work which was offered in livestock. He also worked as a student assistant during his senior year, teaching grain judging. After graduation he came to the University of California to take a year's post-graduate work and to work as a student assistant in the agronomy department. After receiving the degree of Master of Science in Agriculture in May, 1911, he took up the teaching of agriculture in a high school for two years, during which time he also did agricultural extension work, which consisted chiefly in lecturing at farmers' institutes. In the summer of 1913 he was regularly employed in the agricultural extension division under the direction of Professor W. T. Clarke, then head of the division, in which division he has served ever since. During the summer of 1915 he bought a 193 acre tract of alfalfa land in the San Joaquin Valley, which he improved and established a dairy upon. Since that time he has been operating a dairy and gaining actual experience in farming in California.

VENTURA'S APRICOT INSTITUTE

The apricot growers of the Ventura County farm bureau will hold a one day institute the latter part of April in Santa Paula. The major problems of the apricot industry will be under discussion.

The Kern County farm bureau dairy department has appointed a committee to take care of the Dairy Day at the Kern County fair to be held in October. This committee consists of H. K. Dickson, instructor of agriculture, Bakersfield high school; P. G. Grundt, chairman of the dairy department, and P. G. Penfield, county dairy inspector.

The agricultural extension service of Kern County has conducted this month three vine planting demonstrations with a total attendance of 70 people, and three cutworm control demonstrations with a total attendance of 71 people.

Harvest Your Hay The Thomas Way

You can reduce the overhead cost of production of your hay crop and increase your profits by using Thomas hay machinery. Harvest your hay the Thomas way,—it requires fewer men and covers more acreage; delivers more tons at less cost than other methods of harvesting.

The Thomas Mower will cut clean and the side delivery rake will throw the hay into even windrows. One man on the wagon with a Thomas loader can handle more hay than four men can throw with forks. The element of time and labor saving will add to your profit as well as giving more efficient results with the least physical effort.

Write us for prices and booklets on the Thomas line of hay machinery.

THE THOMAS Single Cylinder Windrow Loader

Cylinder is 6 feet 4 inches long. All steel frame strongly braced; wood used only when it serves better. Mounted on heavy steel wheels which are provided with lugs to prevent slipping. Draft is unusually light; cylinder is mounted on the heavy main axle to which cylinder ends are keyed.

The raking bars, of extra heavy welded pipe, work in slots in the cylinder ends and are provided with springs which relieve the bars and save the teeth when obstacles are encountered.

Automatic hitch with rope attached so that man on the load can disconnect the loader from the wagon.

THE THOMAS SIDE DELIVERY RAKE

is well-made, noiseless, strong and efficient. It has more clearance on delivery side than any other. Works equally well in hay or beans. Rakes 8 to 9 Feet Wide. Cylinder is 10 feet long; heavy steel wheels of large size; two Castor wheels which are raised or lowered from the seat by a single lever. Steel throughout.

THE THOMAS ALFALFA RAKE

is made to meet the demand for an exceptionally strong, well-built machine that will do the hardest work, under the most severe conditions, easily, with the minimum of effort on the part of the operator and to eliminate troublesome and expensive breakages.

As the name implies, it was designed primarily for work in heavy Alfalfa, but is adapted to the heaviest work in any kind of hay.

If you want a Rake that will give you no trouble, that is always ready for use, requires no repairs and above all, that is easiest to operate,—BUY A THOMAS ALFALFA RAKE.

THE THOMAS CROWN DOUBLE SPEED MOWER—FOR TEAM OR TRACTOR

The Thomas Crown Mower is the only two-speed mower made. Made in both single and double speed type. Sizes 3½, 4½, 5 and 6 foot, with 4½-inch heavy rim ground wheels. Slow speed for 90% of work, causing less wear. High speed for very heavy work. Cutting where other mowers fail.

The foot lift and hand lever work in conjunction automatically, and with the gag lever gives absolute control in raising and lowering the bar. The tilting lever is easily operated, with ample adjustment for any condition of the grass.

The swath board is adjustable so it can be raised or lowered. Double eccentric steel arch connection, stronger, more adjustment than others, and giving practically instantaneous adjustment on cutting bar.

Inner shoes malleable, not cast iron, as are many others. Wearing lugs in heel of each guard, less friction, better support for knife. All boxes removable; no wear on frame. Ball thrust bearing for crank shaft pinion. Heavy drop forged steel pitman straps. Sliding hitch, direct pull; no side draft.

Caterpillar
Holt
builds it

Six months ago —
we said "Caterpillar" T-35 is the supreme
small tractor. *Today* the experience of
every purchaser of a T-35 proves the
right to that claim of supremacy

About six months ago when the first announcement of the Model T35 "Caterpillar" Tractor was made, we termed this little machine "The Supreme Small Tractor." We knew we could expect big things of the T35, but the tractor itself has exceeded even our highest hopes—in economy, in dependability, in power, in endurance—in every quality by which tractors are judged.

Vineyardists, orchardists, general farmers, contractors, loggers, road makers—power users of every class have been quick to recognize and appreciate the superiority of the "Caterpillar" T35 Tractor. Their purchases have placed these tractors in work of every nature, both tractive and stationary—work that has pre-

sented the most severe tests possible: continuous day and night work over long periods, extreme tests of power, operation on steep hills and on soft marsh land, in sand, over rough roads, in heavy dust. T35 purchasers are, without exception, more than satisfied—really enthusiastic over this tractor's performance in actual field service.

Rapidly increasing production now makes early deliveries of T35s possible. It is advisable, however, to place your order early. Don't delay a thorough study of this tractor—an interesting folder, containing full information, letters from users, etc., will be sent on request. Use the coupon below.

To sum up briefly, the specifications of this tractor—it weighs less than 4,000 lbs., has 25 motor and 15 drawbar horsepower, is only 48 inches wide, has astonishingly big capacity for work in proportion to its size, exceptionally low fuel and oil costs, minimum upkeep expense, adaptability to an extremely wide range of work and to all kinds and conditions of ground and weather. It is exceedingly easy to operate, simple in design and possesses perfect accessibility. There is not an ordinary carbon steel gear or shaft in the entire machine—all are nickel steel, chrome nickel steel or chrome vanadium steel. All bearings, except in the motor, are anti-friction—ball or roller. All working parts are completely enclosed from dust and dirt.

Exclusive T35 Features

Wonderful new overhead valve, overhead camshaft motor with machined combustion chambers, vanadium steel crank shaft, connecting rods, rocker arms, etc. *All bearings floated on oil under pressure.* This is the motor that caused so much comment among engineers at the recent Pacific Coast Auto Show.

Extra large multiple disc clutches—positive action—same type as used in highest grade motor trucks. Three-speed transmission, giving a range for every line of work. All gears and shafts made of nickel steel specially heat treated. Cushioned automatically releasing trucks prevent any possibility of breaking or straining any parts if the track should clog. Newly developed special Holt process track. The greatest development in tracks in recent years. All working parts carried in oversize ball and roller bearings. All working parts completely enclosed and running in oil bath. Greater accessibility than any other tractor on the market.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Cloud on Title

In the seventies my grandfather deeded property in Illinois to my father's minor sister. The deed read "to her and to the heirs of her body." By the guardian of her estate this property was sold and some years later my father purchased it from the vendee. The sister has since married and has several children. The claim is now made that after the death of this sister these children will have an interest in this property. What steps could my father take to clear the title and is there any such cloud upon the title?—Subscriber, Fillmore.

The situation presented by the use of the words "heirs of the body" is one which is highly technical and it would be necessary to inspect the deed as a whole to determine just what effect it would have. These words may be used to create a life estate with the reservation of the remainder to children, or, on the other hand, the same words under the "common law deed" are frequently used to create what is known as "fee simple estate." It is probable, however, from the history of the matter, that there actually is no cloud upon the property, and even so, that this cloud has been wiped away by the long continuance in possession of other parties. If there is a cloud it would require either a deed from the sister's children or a court action in Illinois to clear it.

Bills Outlaw

Eight years ago I did some orchard work for a party. I did not press him for payment, but now when I present a bill he refuses to pay on the ground that it is outlawed. He makes the same claim on his doctor bill. Is he correct?—Subscriber, Beaumont.

An action upon any contract, obligation or liability founded upon an instrument in writing or action to recover upon a book account, account stated, or current account, must be brought within four years. An action upon any other contract, obligation or liability not founded upon an instrument in writing must be brought within two years. There is no difference between a claim of a doctor or for labor. Each of these claims under certain circumstances does have certain preference given in payment of other claims, but the effect of the statute of limitations is the same as on others.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fig Cuttings

Are suckers from fig trees desirable as cuttings?—Subscriber.

This question was referred to Ira J. Condit of the California Reach and Fig Growers. He answers:

"The suckers which come up from the base of fig trees are not usually desirable for cuttings, since they are so pithy that they dry out. It is common practice to pull the suckers from the tree and plant them directly in the field if there are any roots formed. There is no advantage in selecting cuttings from fruit bearing wood, so far as I know; the suckers from the base of trees will make fully as good trees. The trees are leafing out rapidly now and the best season for obtaining cuttings is past. I believe, however, that if the cuttings are taken from two year old wood on which the buds are more or less dormant, that fairly good success may be obtained with rootings."

Manure Pit Near Dairy Barn

Would like to know if I build a concrete bin for manure with top on it would I have to have it made 50 feet from the barn as the law requires for a manure pile?—Subscriber, Orland.

Yes, it would be necessary to have the pit 50 feet away from the dairy barn. Of course if the bin were entirely fly tight the inspector might feel that he would be justified in ignoring the technical violation of the law, but the strict enforcement of the law would require the removal of all manure more than 50 feet from the dairy barn.

Pecan Requirements

What are the requirements of pecan tree as to soil and moisture?—Subscriber.

The pecan has been planted in California since 1870 and has almost invariably done well where best varieties have been used for grafting. Rich, deep, loamy soil, with a moderate supply of irrigation, is necessary for best results. The tree has not become a commercial favorite, presumably because of its extensive planting in other states where lands are much lower priced and where the pecan does fully as well as in this state.

Fly Repellants

I am bothered with the small horn flies on the cows' backs. They were very bothersome last year and now that warmer weather is here they are coming back again. What can I do to get rid of them?—Subscriber, Santa Ana.

There are excellent fly repellants offered on the market, which may be sprayed over backs of the stock. This gives only temporary relief and treatment must be repeated every day or few days. In addition to these ready to use mixtures one may prepare his own as follows: Crude petroleum, 1 gallon; powdered naphthalin, 4 ounces. Cut the soap into thin shavings and dissolve in water by the aid of heat. Dissolve the naphthalin in the crude oil, mix the two solutions, put them into an old dasher churn, and mix thoroughly for 15 minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Sparrow Pest

I am bothered with the small brown sparrows. They eat the young garden stuff as fast as it comes up. Can you suggest any way of getting rid of them?—Subscriber, Santa Ana.

Poisons are always objectionable with birds. If there is no other means of eradicating the sparrow poisoning by the use of strychnine may be resorted to. But a better way is the use of the net or wire screen trap or box into which the birds are lured by feeding a few mornings. When filled the trap is sprung. A small shotgun is also effective because of killing some and frightening more away. However, the satisfactory sparrow control has not been devised.

Overhead Irrigation of Grapes

Please advise me as to overhead sprinkling for grapevines in small vineyard for home use. Soil is very sandy and on steep grade.—Subscriber, Delhi.

So far as grape vines are concerned we can see no objection to using the overhead sprinkling system. However, it seems to us that it would be much more economical and much easier simply to irrigate with open ditches on contours or build basins around the vines. The water should be held on the ground long enough to penetrate to a depth of several feet. On a steep slope the water from the overhead system might run off too rapidly unless there were basins or checks to hold it. There will probably be greater danger from mildew with the overhead system because of the

leaves and canes being so thoroughly soaked each time there is an irrigation.—F. K. H.

Seats for Cannery Employees

Do all canneries in California have stools for women to sit on? If not, in what sections do they use them?—Subscriber, Newberg, Oregon.

It is required by state law that seats be furnished for women employees. We believe this law is obeyed in practically every cannery and dry yard in the state.

Applying Fresh Manure

I intend to put fresh horse manure around young peach trees after plowing. Is this injurious to young trees?—Subscriber, Vacaville.

Many producers in California are applying the manure fresh from horse stable or cow corral. Of course, if put on in large quantity, that is, piled so thick around trees that it generates heat or ammonia sufficient to injure the trees that might be occasion for loss. The application of such a quantity, however, is seldom made. If scattered about freely, so as not to rest against the trunk, there is little probability of heating or of injuring. However, there is an advantage in working even fresh manure into the soil where irrigation carries the fertility to the roots and where partial covering with soil prevents undue drying out.

Rabbits in Watermelon Field

Will you please advise me what poison would be best to use to kill rabbits; the largest amount the quickest way? I am planting 200 acres of melons and grapes, and rabbits are a great injury here to us.—Subscriber, Alpaugh.

The best protection is a rabbit proof fence. Apparently that is not available. The next best protection is secured through the use of traps, if one has sufficient force of workers to keep them set. From an economical standpoint strychnine on an attractive bait is usually resorted to. With growing vines there is no "protector" available, so the only remedy is the destruction of the animals. However, there are some growers who surround the field with attractive feed for the pest, occasionally poisoning the bait, though the principal effort is to decoy the pest away from the growing crop. After the green native feed of the fields dries up juicy fruit baits are usually most attractive and a small quantity of strychnine in these baits proves as quick and efficient remedy as can be secured. Bear in mind rabbits come long distances for food and the complete destruction of the visitors for one day seems to afford little relief the next so there is a continuous distribution of fresh baits required. The keeping down of weeds which afford hiding places for the pest is also beneficial. If not near a grain field where rabbits have access to one of their favorite foods, use poison of 12 quarts oats, 1 ounce powdered strychnine, 1 tablespoon starch, 1 ounce soda, 1/4 ounce saccharin, 1 quart water. Mix strychnine, starch, soda, saccharin thoroughly, stirring into small quantity of water added to the remainder, which may be boiling. Stir and boil until a clear paste is formed, then stir in the 12 quarts of oats and the bait is ready for distribution. Meantime shotgun and trap may also be used. If there are surrounding grain fields then this bait may not be attractive and it may be necessary to use slices of apples in which powdered strychnine has been inserted. Warning should be given surrounding stock owners before the poison baits are distributed.

Seedling Oranges

Kindly tell me what is the best way of growing seedling oranges? Do you sow the seed in flats or in the open ground? When planting out how far should the rows be apart and how close are the seedlings planted in the rows? Is it desirable to sow the seed under glass? What kind of orange seed is considered the best?—Subscriber, Santa Barbara.

No flats are too shallow for the tiny tap root of the seedling orange. The seed is often grown in narrow beds in a bath house, being practically broadcasted and covered with fine sandy loam. Again, they are planted in rows,

say 10 or 12 inches wide, and irrigated by allowing water to run over the entire width of the row. It is yet a bit early for the planting, though some do plant in March and planting may be continued until May. After scattering the seed over the prepared soil it should be covered to a depth of nearly an inch with sand which has been thoroughly screened. The seed should be allowed to grow for about 12 months in these beds, when the small plants may be taken out and reset in nursery rows, with trees in the row at least six inches apart, and rows, say, four to five feet apart. Some nurserymen prefer a distance of from 12 to 14 inches apart in rows. This allows for balling of the trees, which, of course, is not possible when too close together. After remaining in this nursery row for a year the trees are budded. The third year is given to growing the new top. The best information on planting and caring for young nursery trees is given in "The Citrus Fruits" by R. M. Teague, San Dimas. Seed sown under glass would probably not be as hardy as that grown in the open, or, as is

usual, under a lath screen. Seed often preferred is the common sour orange of Florida.

A Profitable Plum

Would like to know if it is necessary to plant with 10 acres of Kelsey plums some other kind of plums before they will bear heavily? Also, could you tell us some kind of a cover crop that would benefit the Kelsey plums?—Subscriber, Fresno.

The Kelsey is self pollinating. Wickson says: "Very widely grown but less in favor than formerly in interior valleys where color is not well developed. As a rule the Kelsey bears heavy crops without necessity of pollinating. If the ground is recently planted it is probable native grasses will afford a good green manure crop for the first year or two. We have known of good returns from the planting of common bur clover, though it does not give great tonnage. Any of the legumes, especially melilotus indica, planted in the fall, makes a good cover crop."

Fertilizer for Dahlias

Is dried blood or lime direct from slaughter house of value in fertilizing dahlias?—Subscriber, Los Angeles.

Dr. R. R. Snowden answers: "Both dried blood and lime direct from the slaughter house are good fertilizers for dahlias, but it is not good to mix them since the lime, if of the caustic kind, will liberate the nitrogen as ammonia and thus cause its loss. However, in any case if mixed with an adequate amount of gypsum the loss will be eliminated. Not having any idea of the proportion of these constituents of the slaughter house product, I could not suggest the amount, because the amount of lime proper to use would be very much more than the amount of dried blood that could be profitably used. But in any event it would do no harm to apply the mixture at the rate of 1,500 pounds per acre."

Rabbits With Boils

I have some finely bred Belgians, some of which are affected with what

The New Model "F" Cletrac

REG. U. S. PAT. OFF.

\$675 Delivered in California

Does All Farm Work

HERE is a tractor so far in advance of any tractor you have seen that it will make you figure power farming all over again.

Until we actually saw Cletrac F at work and learned its price, we did not believe it was possible to build a crawler-type tractor with chrome steel for every part subject to severe wear and sell it for so low a price.

Cletrac F is the value of the hour. Its power is ample to pull two 12 inch bottoms—to turn under 6 to 8 acres a day. In the same proportion it speeds up all other farm work—discing, seeding, haying, harvesting, hauling, belt work.

Lays its own tracks anywhere and everywhere you want it to go—automatically lubricated—all working parts accessible—handles any job on the farm—and its low price will meet your means today.

Remember this—here is a tractor against which old methods of farming cannot compete. We'll be glad to put it through any test or demonstration—without obligation to you—and stake our reputation on the result.

THE CLEVELAND TRACTOR CO.

"Largest Producers of Tank-Type Tractors in the World"

19077 Euclid Ave., Cleveland

PACIFIC COAST FACTORY BRANCHES

LOS ANGELES, CAL. SAN FRANCISCO, CAL. SPOKANE, WASH.

appear to be ordinary boils or carbuncles. Am feeding limited amount of carrots and greens, with some grains, especially rolled oats. Stock

appears to be perfectly healthy excepting for these boils.—Subscriber, Los Angeles.

This is somewhat out of the ordinary. The first suggestion is that the trouble may be caused by too rich feed. If such is the case a reduction in the amount of rolled oats and an increase in the amount of green feed may be helpful. Washburn's "The Rabbit Book" says: Boils may be lanced, the pus squeezed out and the opening washed with a mild disinfectant (peroxide, for example) not harmful to the animal. When abscesses occur, represented by large, swollen areas filled with pus, the condition is more serious and may become chronic. From personal observation we believe a tendency to formation of abscesses may be inherited. We have known of at least one doe who showed a marked tendency in this direction as she aged, and some of her young exhibited this condition to such a degree that the meat was valueless. Treatment for abscess is same as that for boils, but where it becomes chronic, spreading over large areas on the animal, the creature should be killed and buried.

Rabbits Pay

Can you give any information on the subject of rabbits for market? What is a good breed?—Subscriber, Compton.

A fund of information as to rabbits is given in the article and especially chart by W. D. White on another page. The varieties best for fur and best for meat and even the fancies or pets are there indicated. As to profit, that depends, as in any other business, on the grower, and there again Mr. White's article gives some remarkably good hints. It has been stated that the young from one strong, healthy doe will produce 90 pounds of meat in a year. Our market page gives the range of prices, not counting the green or forage which may be picked up, for feed which would produce this 90 pounds of meat, and this would not exceed one-fourth the market price. We would not advise anyone

to dispose of a paying business and enter the rabbit business, but as a side line it may yield a satisfactory profit. Then, in the course of a few years, one may find himself so fitted for the business that large development may follow.

Rheumatism

Are there any localities in California especially suited to sufferers from rheumatism?—Subscriber, San Diego County.

So far as locality is concerned we do not know of any place in the world where absolute immunity from rheumatism can be guaranteed, but within a few hours' drive of the home of the San Diego County subscriber, in fact, just over the line in Riverside County, are the Elsinore Hot Springs and not far from them the Murrietta Springs. Near Hemet and San Jacinto there are others, and these we believe have afforded help to many a rheumatic sufferer.

Dahlias and Gladioli at Fresno

I would like to learn from someone living in or near Fresno the proper care of dahlias and gladioli. On the coast I know dahlias are planted so as to get the sunshine all day and catalogs say to plant them that way, but will they stand the full sunshine of this valley? Should they be protected in the afternoon or would it be, all right to plant them where they get the sun for about three hours in the morning and are shaded by trees the balance of the day? Is it necessary to lift the bulbs in the fall? I would also like to ask if gladioli are of any value here, blooming as they do during the hot season? They are so lovely I wish to raise some if I can get them to grow here.—Subscriber, Fresno.

Dahlias revel in hot sunshine but develop best where soil is kept cool and moist. The upper side of tubers should never be less than four inches below the surface of soil, and stand them up as they grow, eyes on top, never lay on side. This is important, for large tubers may be eight inches long and this would place the lower

end at least a full foot below the surface; as they root first from lower end this treatment provides a cool soil for the roots. Keep soil stirred deeply except within six inches of the stalk. Fresno should grow as good dahlias as any part of the state but they should be planted in March. To have best gladioli the bulbs should be planted in January. Plant six inches deep, and in hot weather, especially during flowering season; water almost every day, heavily, if drainage is good. Nearly all species of gladioli grow in or close to marsh lands or "swamps."

Grafting Walnuts

When is the proper time to graft the walnut?—Subscriber, Colusa.

Right now. See article on page 121 of the issue of February 4.

Sweet Butter

A subscriber at Selma sends the following hint to subscriber at Santa Cruz who inquired in a recent issue as to sweet butter: "Try scalding your milk. Strain in pans then set on stove till hot or scalding, but not boiling. Set outside on table till cool before putting away. Keep milk on porch in cooler so air can get to it. Milk will get strong if kept in close house. After scalding cream will raise quickly and be ready to skim in a couple of days. I churn twice a week and have fine butter. When weather is freezing cold I keep in pantry but it must have air or it will get strong and will take on the taste of other things near it.

Answering the same question Mr. and Mrs. J. A. Peterson of Mountain View write: "Your cows will give sweet milk and butter provided you give best feed. Alfalfa hay and alfalfa meal cause milk to have strong odor. Even if you churn every other day it will have a bad taste. Give best oat hay and middlings. Put a little salt in middlings, wet it some, just enough for one meal at a feed. Give plenty of green feed and vegetables. Also, give no dry alfalfa for a while and see results. If you feed dry alfalfa, give more than half oat hay with it, and once you get good feed, stick to it and do not change to inferior feed."

(We may add that the giving of offensive odors to milk by feeding alfalfa hay is not credited as it once was. All dairymen make alfalfa their principal feed and feeding immediately after milking does not affect odor or taste.—Edit.)

Mrs. H. Wheeler of Sebastopol writes:

"I have had the same trouble during the winter months. No matter how sanitary we have been with the milk, nor how fresh the cow, nor how good the feed, the butter would get strong, sometimes would be bitter. Even when the cream was kept in a warm room it would not sour. Sometimes I would churn two days before the butter would come. All my neighbors complained of the same trouble, but thanks to Hansen's buttermilk tablets, I have had spring butter all winter.

"I proceed as follows: As soon as milk is brought in and strained, set on back of stove to heat until it begins to crinkle,—then set away until ready to skim. After commencing to save the cream take a pint fruit jar, fill with skim milk, add to it one pulverized Hansen's buttermilk tablet. These can be procured from your druggist or he will order them for you. Set the jar in a warm place like the top of the food closet on the kitchen range and stir occasionally. It will take about two days for it to sour and set. Beat up well and add to your cream, keep skimming into your cream and buttermilk until you have a churning. Each time cream is added stir well. Keep in a warm room to ripen. When cream becomes thick, churn, wash the butter well and salt. After a day or two work well and you will have real spring butter.

"If you are churning often, a little of the buttermilk can be left in the jar and more milk added, and it will soon sour again; this way not so many tablets are used.

BESSIE'S ANSWER

The teacher was trying to make Bessie understand subtraction, and she said: "You have ten fingers; now supposing there were three missing, what would you have then?" "No music lessons," said the child promptly.—Boston Transcript.

WE Solicit Your Order For Nursery Stock Because

Bleeding Wart

Our bull has a lump just back of his right shoulder that is about three times the size of a kernel of Indian corn. It is soft and has a very thin skin over it. Sometimes he opens it by rubbing against a post when it bleeds very profusely and he loses quite a quantity of blood. It has been open three times and we stopped the flow of blood with vinegar. Fearing that it will get open some time and bleed too much, we would like to know what will cure it permanently.—Subscriber, Brawley.

Take a red hot iron and burn it to a crisp. Also get at your druggist some Monsell's iron powder and when the scab comes off bind about half a teaspoon on the spot. This should heal it permanently.

Tumor on Eye

What can I do for a cow with a red growth coming over the eyeball? It has been much inflamed for some time.—Subscriber, Chowchilla.

Touch it with a small swab dipped in nitric acid. Be careful and do not use too much of the acid. You may have to repeat it once or twice. Be careful in handling the acid as it is very caustic.

Cow Not Breeding

Have a cow that seems to be in heat most of the time. She becomes very excited when other cows are in heat but refuses the bull. She bawls constantly and makes a noise more like a bull than like other cows. What can I do for her?—Subscriber, Chowchilla.

She is probably barren, may be something wrong with the ovaries. Fatten her for the butcher.

Tuberculosis

Have a cow that has been served four times but has failed to get with calf. After each service she discharges a yellow mucus. What would you advise doing for her?—Subscriber, Chowchilla.

Have her tested for tuberculosis.

Rheumatism

I have a cow three and a half years old that has had two calves. She eats well and was perfectly healthy until about two months ago when she became lame in one hind leg. We called a veterinarian to see her. He said she had strained her leg. He blew up the hip with air and alcohol but she got worse and a large lump formed on the side of the leg and keeps getting larger. She is now lame on the front leg also and a lump is coming there. What is wrong and what can be done for her?—Subscriber, Encinitas.

You did not say just where the lump is but if it is on or near a joint would think it was rheumatism. Try these powders: Three ounces salicylate of soda, three ounces bicarbonate of soda, three ounces powdered nux vomica and six ounces powdered gentian. Mix and divide into 24 powders and give one powder every evening in a little feed.

Wart

Our family cow has developed a wart on her chin about the size of a half dollar. How can I eradicate it?—Subscriber, Parlier.

Get an ounce of nitric acid. Make a small swab and with that apply enough acid to wet the wart but no more. This will form a scab and when the scab comes off wet it again. You may have to use the acid several times, but as soon as the wart seems to be killed let it heal. Be careful in handling the acid as it is very caustic and will burn the skin or clothing.

Actual Photograph of Heavy A & M Dwarf Milo Maize

You'll get the heaviest yield and the best quality from

A & M Selected Dwarf Milo Maize

For years this strain has been kept pure by our growers. We have proved it to be the variety best adapted to our climate and soils.

Its tendency is to stool, and each stool produces from 3 to 7 heads of maize. Your neighbors who have tried it know its excellence.

Insist upon A & M Selected Dwarf Milo Maize.

Some people think they are religious if they don't laugh.

William found a pocketbook but the string jerked it back

It looked like a happy discovery as it lay there on the sidewalk—until the discoverer reached to pick it up. Then the hidden string jerked it away. All William got was disappointment.

That's the way a good many people have found it to be with the comfort and cheer they thought they had secured in tea and coffee. When they came to depend on it—there was a hidden string, and nothing left but disappointment.

The drug, caffeine, in tea and coffee, is a nerve stimulant. Constant stimulation of the nerves often produces rebellion that takes the form of sleeplessness, headaches, irritability, high blood pressure. That's the string to tea and coffee.

Postum, that wholesome and delightful cereal beverage, is completely satisfying and there's no harmful quality whatsoever, to jerk away the comfort which you find in this splendid table drink. Any member of the family may enjoy Postum with any meal—and there will be no after-regrets.

Postum comes in two forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes. Sold by grocers.

Postum for Health

PRUNES

EVERY DAY	<i>For the health that's in them</i>
MONDAY	
TUESDAY	
WEDNESDAY	
THURSDAY	
FRIDAY	
SATURDAY	
SUNDAY	

Health—the real, robust, red-blooded article—pays little heed to the calendar. If a dish is good for your health one day—it is good any day and every day. To use prunes only in the stewed form [and then to use them only “every so often”] is hardly fair—to the prunes or yourself.

Prunes are a natural corrective. Nature has seen to that. Moreover, these natural sweetmeats can be prepared in so many ways that there is always a new dish to tempt your table-folk.

Our new Recipe Packet, “Sun-sweet Surprises for 1922” shows how and it's free! Send for it today!

NATURE'S FAMILY

By O. S. Pinckney

“Come mother,” said Spring to old Nature one day,
“Wake up! let's get busy again.
You've had a good sleep and there's plenty to do
Since the season of snow, cold, and rain.
We must wake up the children and deck them all out
In dresses of purple and green
And cover the branches of all the bare trees
On the hillsides and down by the streams.”

So old mother Nature awoke with a smile
While Spring warmed the air and the soil.
With old Sol's pleasant rays and the warm southern breeze
Together they labored and toiled.
They dressed all the children in bright, shining green
While the daisies and violets bloomed.
Soon all the bare branches were covered with leaves
And the breeze waved the tall willow's plumes.

They wove a green carpet and spread o'er the land
And worked it with figures of blue,
With figures of white and of yellow and red,
Of purple and lavender hue.
The farmer was happy and whistled once more
As he turned o'er the soil in his field;
“It we all work together and each do our share
In the Autumn we'll have a good yield.”

JIMMY'S JOB

By Edward P. Hendrick, in Youths' Companion.

A Jimmy Wales, water boy for the gang on the Dinsmore Street sewer, swung his dripping pail over the edge of the trench and lowered it to the men 26 feet below he grumbled. Something was wrong with the gang in Dinsmore Street. The firm knew it; Coleman, the superintendent, knew it; Jimmy Wales, the water boy, knew it, and he grumbled because—well, because that was the thing to do on a “rotten job like this.”

These were days of worry for the superintendent in charge. The sewer trench cut through a stratum of semi-liquid clay and sand, and there was constant danger that the sheathing that supported the sides of the trench might give way under the tremendous pressure. Every day that the trench remained open added to the danger of accident, yet any request for overtime work met with surly answers.

“If some one would only start something,” thought Coleman, “we'd have a show-down and get it over with. Someone's talking Bolshevism to this gang.”

The noon whistle interrupted his thought, and he watched disgustedly as the men dropped their tools wherever they chanced to be. Jimmy Wales, bringing his pail from the hydrant, stopped in his tracks, set his pail on a pile of sand, flung himself down beside it and, drawing a huge sandwich from his pocket, munched it contentedly.

Coleman strolled over to him. “Jimmy,” he said, “I want you to run down to the blacksmith shop and ask Belcher if he can mend those chains for me right away. I'll need them this afternoon.”

The boy took another bite of his sandwich.

“What's the rush?” he mumbled.

“I ain't paid to work noontimes.”

Coleman sat down beside the boy. Presently he said quietly, “How long have you been with this gang, Jimmy?”

“Six weeks.”

“Is the work too hard for you?”

“No, it ain't; but anybody's a sucker to work overtime less'n they get double pay.”

“Did some one tell you that, Jimmy?”

“Didn't tell me specially. I heard Tim Lawson say so, and—and I reckon he knows.”

Tim Lawson; so he was the sore spot in the gang. The very man who must do his work faithfully and carefully, if they were to complete the job without an accident!

“Jimmy,” continued the superintendent thoughtfully, “did you ever wonder how it happens that I am in charge of this work, while men like Tim Lawson, who were building sewers when I was a kid in knee pants, are still working for a day's pay?”

“You had a pull,” replied the boy promptly. “Lawson says so.”

“He's right,” returned Coleman quickly. “I had a pull, and I have it now. Would you like to hear how I got it?”

“Sure, I would,” grinned the boy.

“How old are you, Jimmy?”

“Fourteen.”

“I was just your age when I got my first job; it was with this same company, and I was water boy.”

Jimmy sat up and looked at the boss with new interest.

“We were building a road over Corliss Mountain,” continued Coleman. “I had to lug water from a spring half a mile away. I'll never forget how my legs ached, and it seemed as if every man on the job drank water enough to drown him. I heard the foreman say that he'd had to fire two water boys because they couldn't hold up their end. Right there I made up my mind he'd never have a chance to fire me. It came easier for me after a while. We got along to where I could get the water from a house close to the job, and I had more time to spare. The boss used to send me on errands from one end of the job to the other, and I liked that because it gave me a chance to see how the work was done. I kept my eyes and ears open, and by the time we finished in the fall I had a pretty good idea how a job ought to run. I went to school that winter, and when construction work opened the next spring what do you suppose happened?”

Jimmy could not guess.

“They sent for me and gave me a job running a concrete mixer. I wasn't any smarter than any of the other boys on the work, but somehow I got the idea that it was the job that counted. Any little extra work was O. K. if it helped put the job along. Since the day when I made good as water boy on Corliss Mountain road I've never had to hunt a job—the job has always hunted me.”

“Him a water boy!” soliloquized Jimmy as he trudged back from the blacksmith shop a little later with two heavy chains over his shoulders. “Well, what do you know about that!”

During the days that followed a little leaven of efficiency appeared in the person of the gang's most humble member. The water boy found time to do little errands for the men. If tools were thrown carelessly about, Jimmy Wales put them where they belonged. Jimmy had naturally a cheerful grin. He used it.

Somehow it began to seem as if Jimmy Wales carried a remarkable brand of water in his pail. Even the worst grumblers had a good word for the water boy.

Among other things Jimmy became greatly interested in the work of pipe-laying, and he made frequent trips to the bottom of the trench, where he bombarded Mike Carson, the pipe-layer, with questions.

“Is it me trade ye'd be learnin'?” chuckled the good natured Irishman.

“I'm going to find out about everything on this job,” replied Jimmy.

One hundred and eight feet of pipe had been laid from the manhole at Summer Street. The digging continued soft, and Coleman frequently cautioned Lawson to exercise the greatest care with his sheathing. The bracer was surly and resented any inspection of his work.

“He's looking for trouble!” he growled. “I'm doin' all I'm paid for.”

It was while the superintendent was at the far end of the job that a heavy maul dropped from the street level struck a carelessly driven cross brace and knocked it loose. With a splinter-crash, twenty feet of sheathing gave way and fell over in the trench, followed by tons of earth.

Beyond the break the men scrambled hastily to the street level. Coleman, running at top speed, joined them and surveyed the group. Tim Lawson quailed before his look.

“Where's Mike Carson?” asked Coleman savagely.

The men were silent.

Throwing off his coat, the superintendent sprang into the trench and dropped rapidly from brace to brace until he reached the bottom.

“Carson!” he shouted. “Mike Carson!”

A faint voice replied. There was a moment of question and answer; then

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

Coleman climbed quickly to the street. "Carson's there, men, and he's alive. The planking has arched over him, so he has plenty of air space; but he says there's a timber across his back that's killing him! We'll have to dig like devils, but be careful not to start any more earth caving."

Only three men at a time could work in the restricted space above the buried man, and as fast as one paused for breath another took his place.

"Where's the water boy?" asked some one suddenly.

"There's his pail," said another; "he can't be far off."

"Has anyone seen him since the break?" asked Coleman sharply.

None could be sure.

For fifteen minutes the men dug like fiends. Suddenly they stopped. From beneath their feet came a queer sound; a sound of a saw, cutting through hard timber. In a moment Coleman was again at the bottom of the trench.

"Mike Carson," he shouted, "can you hear me?"

"Sure, I can!" came the reply; "and it's feelin' better I am since I got half a ton of timber off'n the small of me back! 'Tis this scamp of a water boy done it. He's after crawlin' through the pipe from the manhole, draggin' a saw behind him, and it's himself that cut me clear, not three minutes ago!"

Two hours later they lifted Mike Carson from the trench. As for Jimmy Wales, he had squirmed his way back through the pipe and emerged again from the manhole. The men raised a cheer at sight of him. Some one suggested taking up a collection.

"Forget it!" grinned Jimmy. "I'm drawing pay from the company. Anything is O. K. if it puts the job along."

OUR BABY COLUMN

By Mrs. M. S. Sirdevan

I hope that mothers will find many helpful hints in this column, and not only ask questions, but write and tell me how they have met some of the problems that confront a mother of today.

Wholesome Food at Regular Hours

If possible, a child should be given his hearty meal at noon and a simple supper consisting of cereal, coarse bread and a glass of milk.

Fruit is better if given at 10 o'clock in the morning, as acids should never be given with milk. Dates, prunes and black figs are very good, where a child is troubled with constipation. Avoid giving sugar and use pure honey on cereals, puddings and bread. Have them drink the vegetable waters, such as onion, carrot and spinach, cooking vegetables in as little water as possible. Most children are very fond of grated carrots (raw) and lettuce with honey on it.

Vegetables at Noon

No question comes to me more often than: "How can I get my child to eat vegetables?"

Children differ so, that it is very hard to tell just what will appeal to them individually, but this is a plan that proved very successful with my little girl of two and a half years. At each noon meal we laid out a garden according to our vegetables, using potatoes for the walk, carrots for flowers or bricks as a border, spinach for the lawn, and the peas were usually the children playing in the garden, for they rolled around. Cauliflower represented trees or bushes, and string beans were soldiers, and so on, until our garden was complete. By digging the garden up, to be in readiness for tomorrow's planting, we had to eat everything. In a week's time my little girl was planning her own garden.

Drinking Milk with Straws

Many mothers find it very difficult to get their children to drink milk, and for this I would suggest straws, such as are used at the soda fountains. These have a fascination for children, and many a dose of castor oil with orange juice has been taken in this way.

To Prevent Chafing

Another of the very common problems is prevention of chafing. If the child wets the bed, be sure and wash him every morning when he arises, with warm water and soap from his waist down. Never use the second time diapers or a piece of clothing

that has once been wet, for it is the urine that scalds. Oil the parts well with paraffin oil. This can be purchased at any drug store.

HOUSEHOLD QUERIES

Soft Soap

Please give me directions for making soft soap out of cracklings.—Subscriber, Riverside.

If the cracklings have been properly pressed they have lost most of the fat which is needed in the making of soap. However, if one has other greases there might be sufficient value in the cracklings to add to the right solution as given by Mrs. L. B. Brown in this department March 18.

Use a coal oil can (top cut out), 2 gallons cold water, 1 can lye. Boil and add 5 pounds lard, stir until it ropes, take from fire and add 3 gallons boiling water, stir until smooth, let cool and if a little harder soap is wanted set in sun to dry.

Recipe Wanted

Will some one please give a recipe for cookies made with steel cut oats?—Subscriber, Sebastopol.

For recipe in answer to this request, sent to Household Department, California Cultivator, 317 Central Ave., Los Angeles, by Saturday, April 15, subscription credit will be given for one year if recipe is published in the Cultivator.

Who Has the Music?

I noticed you printed the words of "The Dying Cowboy" in the Cultivator last week. I wonder if I could get the music for those words from some subscriber. Am willing to pay for it. Please address Ruth Christensen, R. E. Box 177, Fresno.

Sugar Cured Bacon

Please tell me how to make good bacon. We have been trying for three years but always our bacon is too dry.—Subscriber, Sebastopol.

These directions are given by W. V. Cruess in "Home and Farm Food Preservation," an invaluable book for every farm home maker. Mr. Cruess writes from practical experience. He is now a member of the faculty of our state university.

Pack bacon strips in barrel. To each 100 pounds meat allow 8 pounds salt, 2 pounds brown sugar, 2 ounces saltpeter. Dissolve in 4 gallons water and cover meat with brine. For summer use it will be safer to boil the brine and allow it to cool before using. Place board on meat with weights to keep immersed in brine. Bacon strips should remain in brine four to six weeks. In case brine becomes slimy or ropy remove it, wash meat and cover with fresh brine made as the first. When ready for smoking rinse off adhering salt and allow to drain. Hang in smokehouse. If fire is built directly under the bacon, bacon must hang six or seven feet above. Smoke continuously for two or three days or smoke three or four hours each day for about two weeks. Use hardwood or spent tan bark for smoke. The wood should smoulder and smoke, never burst into flame. As soon as sufficiently smoked open smokehouse wide and allow meat to cool. When thoroughly cooled remove and wrap each piece closely in paper. Put wrapped pieces in strong sacks and tie well at top. Sacks should be hung where they are to remain till meat is used. Sacks should be coated with thick paste of lime, water and enough glue to make mixture stick. Do not stack in piles. Hang so pieces do not touch.

Crackers—Marshmallows

I would like recipe for crackers like those we buy. Also marshmallows.—Mrs. Otis A. Carpenter, Earlimart.

Crackers—Sift 1½ pints flour, ½ pint corn meal, 1 teaspoon baking powder, 1 teaspoon salt. Rub in 2 tablespoons butter, ¾ pint milk; work into smooth fine dough. Place on breadboard, kneading a few times, and roll to quarter inch thickness; cut with small cutter, lay on greased baking tin, puncture top of each cracker with fork, brush over with milk, bake in hot oven.

We have not available a good recipe for marshmallows. Can any of our readers help us out? Please send to Household Department, California Cultivator, Los Angeles, by April 15.

The Cultivator Patterns

3891-3898. Ladies' Costume.—Blouse 3891 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3898 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. Its width at the foot is about two yards. To make the dress for a medium size requires 5½ yards of 40 inch material. Two separate patterns, 10c for each pattern.

3626. Junior's Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 4½ yards of 27 inch material. Price 10c.

3560. Ladies' House Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 5½ yards of 36 inch material. The width of the skirt at the foot is two yards. Price 10c.

3881. Ladies' Skirt.—Cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. A 24 inch size requires 2½ yards of 36 inch material for the skirt, and 3½ yards for the tunic. The width of the skirt at the foot is about two yards. Price 10c.

3885. Misses' One Piece Dress.—Cut in three sizes: 16, 18 and 20 years. A 16 year size requires 4½ yards of 36 inch material. The width of the skirt at the foot is about two yards. Price 10c.

3886. Girls' Glimpe Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size requires 1½ yards of 32 inch material for the glimpse and 3½ yards for the dress. Price 10c.

3692. Ladies' Apron.—Cut in four sizes: Small, medium, large and extra large. A medium size requires 3¾ yards of 36 inch material. Price 10c.

3883. Ladies' Waist.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 3¾ yards of 27 inch material. Price 10c.

PRICE OF ANY OF THE ABOVE PATTERNS

10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

THE CENTRAL LIVESTOCK MARKET

(Continued from Page 381.)

The Cost

The cost of cattle buying in country will average \$2 per head, as compared with 25 cents per head on a central market. Other and even more serious losses come from a failure to save the waste feed of the ranch by feeding it at home, and that item alone is enough to produce a fairly good animal, but we also lose by not marketing the grain in the animal and from a lack of fertilization of the soil by having animals on the ranch; also by loss to the labor of this section.

Another big expense and waste that centralized marketing would eliminate is the practice of the packers of finishing cattle in their own feed lots. There is a period from April 1 to October 1 (between hay and grass) when the packer must solve his own problem of supplies, depending on the feed lots in California or adjoining states. To fortify himself, he puts cattle on feed around the place and elsewhere so that distribution may not be completely suspended. To say nothing of the extra freight on the feed from the country to the feed lots as against marketing it in the animal, the interest on the valuable land and extra space required for that purpose is a big item. But a more serious item is the loss of a market by the fellow who has finished some cattle and is looking for a place to sell them. Clearly, the packer demand is supplied from his own source, and during that period he is off the market so that the other fellow must ship elsewhere.

A central market would reduce the cost of manufacturing and distribution by furnishing a constant supply of the right kind of animals, require less land for conducting the packing business, and by saving the big expense attending the purchase of animals at the ranch.

The Reason

The present conditions are the result of the cutting up of large ranches into smaller units for agricultural and horticultural development without providing ways and means for the smaller units to take the part they are so well fitted to take in finishing food animals.

The Remedy

There is now, and probably always will be, a very large area in California and adjoining states of mountainous land suitable only for grazing and breeding. Such sections should produce the animals to be finished on the smaller ranches and moved thence to slaughtering or manufacturing points. A central market, where the finished animal and the feeder are in active demand, would bring this about with enormous benefits to the breeder and feeder.

Admittedly, the grass cattle supply is an important part of the meat food supply and there will always be a demand for that class of cattle, but by proper grading the relative value of the grasser as compared with the finished animal will create a basis of value helpful to both classes, just as exists now in the eastern markets, all of whom get their seasonal supply of grass cattle and at the time when the feed lot cattle are also moving. The fact that grass cattle in all sections of the country represent seasonal movements and that something must be done to provide a supply in the interim should be fully recognized and dealt with accordingly. The comparatively short distance from the breeding ground to feed ranches is a condition peculiar to the state of California and an economic advantage of immense importance.

Through the medium of a central market a complete survey of the livestock and feed situation of the state should be inaugurated so that the possibilities of feeding and production may be developed and worked out in an intensive way. Apparently there is no problem today of such great importance to every person in the state. The Iniquities of Country Buying

Leaving out the question of the great waste previously pointed out, here are a few of the things possible under present practices of ranch buying: Opportunity for discrimination between the ranchmen as to price, shrinkage deducted for shipping, division of ranches or territory between packers, grading.

To illustrate: The price is a matter

of agreement without a yardstick to measure the value. A market properly constituted would have market prices at all organized markets and a forecast of receipts. The prospective receipts could easily be obtained for the home market as well as a record of the day's sales and probably strength or weakness of the market for the next 48 hours. This is a part of the work of selling agencies at all markets so that the supply and demand may keep pace. Apparently the penalties of the stockyard law do not reach ranch trading. All trading on the market is subject to federal observation.

As to Shrinkage

It is customary where sales are made f. o. b. shipping point to deduct from the scale weights at such point a certain per cent for transit shrink. Assume that Smith drives his cattle ten miles and Jones drives his 20 to the railroad, both allowing three per cent shrink in shipping. The result is that Jones gets less money for perhaps a better grade. On the market all sales are made after a fill of feed and water, which would largely restore the loss of shrink from the drive and in shipping so that both shippers would be on an equality.

As to Division of Ranches or Territory

There would be no such thing possible on the market.

As to Grading

It is a recognized fact that the average producer knows little or nothing of how the animal looks on the hook or in the beef, and still he matches his judgment in selling at the ranch against the knowledge of years of training and experience of the packer buyer who wants the meat and not the frame, so that in the matter of grading he cannot hope to successfully compete with the buyer. The market has expert salesmen who know the meat yield as well as the buyer and better than the owner. The owner could come to the market and observe the operations and know definitely what his neighbor got for his cattle, and if any substantial difference, the reason for it.

Development of the Packing Business

Modern packing plants utilizing and putting into commercial use many parts of the animal now tanked for fertilizer means a big saving to the industry which will benefit the consuming public. The use only of the meat food or edible part of the animal is a direct tax upon the consumer's purse. Better breeding and feeding and an increased quantity means an expansion of the industry, and the increased demand means better prices to the producers.

Loss by Condemnation

During the year 1920, 18,000,000 pounds of meat were condemned at plants operating under federal supervision throughout the United States, which represented about one-fourth of one per cent of the total amount handled by such plants. This waste resulted from diseased, crippled and bruised animals, and occurred in a section of the country where a great deal has been done by the federal and local governments to eradicate disease and prevent injury to the feed animal. It would be interesting to know what the figures are in Southern California, where there is no organized attempt to save the waste.

Central Marketing

The Southern Pacific slope is the only section of the United States where the central marketing of livestock has not been put into effect, and in all such cases the results have been of great benefit, in fact, proven the backbone of the agricultural and farming industry, and the marketing points have developed into big and prosperous cities. Iowa, for example, is a feed lot for the Omaha, Sioux City and Chicago markets, and the farmer is wonderfully prosperous. Any other states engaged in livestock production and marketing under the centralized system are equally prosperous. Can it be possible that this marketing plan so successful everywhere else is all wrong and that the present system in the Southern Pacific slope is right?

Transportation Conditions

Generally throughout the United States, stocker and feeder animals are transported at a freight rate three-

(Continued on Page 397.)

The IOWA

AT THE PANAMA PACIFIC INTERNATIONAL EXPOSITION

At the Panama Pacific International Exposition the IOWA Cream Separator out-skimmed all competing machines in every test made by the jury of dairy experts. In one test its closest rival left 47 times more butterfat in the skim-milk than the IOWA did.

The IOWA Cream Separator has shown results no less remarkable in thousands of skimming tests held on dairy farms throughout the dairy states.

Iowa Curve Disc Bowl

The famous Babcock test has positively proved that the IOWA Cream Separator with the patented curve disc bowl is the closest skimming device known.

One dairyman used the Babcock test and found a waste of 364 pounds of butterfat out of 1200 pounds produced. Day after day, year after year, this profit-destroying, unnecessary waste had gone on. His cream separator was literally "stealing him blind." Thousands of other dairymen have had the same experience.

In scientific cream separator circles, in leading agricultural colleges and on hundreds of thousands of dairy farms, the IOWA system of Curved-Disc skimming has proved its wonderful superiority.

IOWA Curved Disc CREAM SEPARATOR

Why is it that over thousands of dairy farmers have turned to the IOWA Curve Disc method of skimming? The reason is plain. Thousands have been testing the honesty of their Cream Separator by the Babcock test, and they have found their machines leaving valuable butterfat in the skim-milk.

Stand an IOWA Curve Disc beside your cream separator—divide the milk—run half through—then let the Babcock test tell the result.

IOWA Will Pay For Itself

The IOWA actually will pay for itself out of the butterfat that, as a result, would not have been saved if an IOWA "Curve Disc" Cream Separator had not been used. Ask your dealer to give you an IOWA Curve-Disc skimming demonstration at once. Meanwhile write for our literature that shows the IOWA waist-low supply tank, automatic disc cleaner, the curve disc and other exclusive features found only on the IOWA.

DISPERSAL SALE

Ormondale Shorthorns

60 REGISTERED COWS
HEIFERS and BULLS 60Ormondale Ranch, Redwood City, Calif.
Thursday, May 4, at 12 o'clock Noon

The dispersal of this splendid collection of Shorthorns under the auctioneer's hammer will provide one of the most attractive opportunities for purchase yet afforded by the breed in the West.

The female offering will include both Scotch and Scotch topped sorts, ranging from great matrons with calves at foot, to open heifers. Many of the heifers are sired by Imp. Boquhan Guinea Stamp, and the bred females are in calf, either to THE CALEDONIAN, an outstanding prize winning son of Imp. Caledonia, or to COUNT KINGWOOD, a splendid son of Imp. Kingwood.

A female group that attracts particular attention is that of the great producing cow SWEETHEART and her three daughters. She is the dam of the International Grand Champion LITTLE SWEETHEART, and two of her heifers in this sale are full sisters to Little Sweetheart, sired by Golden Goods, Jr., while the third is by Ormondale Itadium.

THE CALEDONIAN and COUNT KINGWOOD both sell, and from every standpoint they command the attention of the buyer who requires a high class herd header. There is also a choice group of younger bulls.

GUARANTEED BREEDERS—TUBERCULIN TESTED

TERMS OF SALE: Responsible parties may arrange for credit before sale with the sale managers on the basis of one-half cash, balance in six months.

ORMONDALE RANCH is about 9 miles southwest of Redwood City; about 36 miles south of San Francisco. Morning trains will be met at Redwood City morning of sale.

Profitable.

This offering of bulls should prove a real opportunity for the range man. They are the right kind—short legs, blocky, mountain raised and range fed. The kind that produces real steers and makes money for the buyer. This sale will be the last opportunity for California cattlemen to buy Hereford bulls at auction this spring.

10—Cows and Bred Heifers—10

The females have been selected with care and are just the sort for the beginner or the man wanting to establish a herd for the production of registered cattle. They are a splendid lot.

I have recently located in Stockton and this will be my first annual sale in the San Joaquin Valley. Come and get acquainted with my cattle.

Jerseys

May 9, Geo. H. Thomas & Son, Arlington Station; sale at Hynes.

Herefords

April 20, H. M. Barngrover, Stockton.

S. B. Stafford was reelected president of the Chicago Livestock Exchange for his third consecutive term at the annual election February 13. T. E. Swiney was elected vice-president, and T. W. Jerrems, E. G. Fuikerson and W. L. Compton, directors for a term of three years.

President Ellenwood of the California Wool Growers Association is attending the annual of the National Association at Salt Lake.

A Woodland, Yolo County, wool grower has just made sale of a carload of wool at 20 cents a pound.

Announcement is made this week of the annual sale of Shorthorns from the herd of Caledonia Farms, West Sacramento, to be held May 25. Since 1920 the annual sales from this breeding plant have been among the most important events in livestock circles and have served to distribute a class of cattle of superior merit. As usual the offering will make available the blood of the three great Caledonia herd bulls—Imp. Caledonia, Pine Grove King and Gainford Matchless. Between 30 and 40 head of females will be catalogued and at least five high class young bulls will be included. As in former years the sale will be held at the farms and will be under the management of the California Breeders Sales & Pedigree Company. Additional details will appear in due time.

The Holstein-Friesian heifer Pietertje Ormsby Mercedes Frisby has broken the record for fat production in the junior two year class of the seven day division by producing in seven consecutive days 452.1 pounds milk, containing 26.327 pounds fat. She freshened at the age of 2 years, 5 months, 8 days. Her sire is Pietertje Ormsby Mercedes Della; her dam, Colantha Changeling Frisby. In the junior two year class of the seven day division she displaces the heifer Eco-Sylv Belle, whose record for seven days is 24.908 pounds fat from 439.7 pounds milk. Computed on the 80 per cent basis, the equivalent butter claimed for Pietertje Ormsby Mercedes Frisby amounts to 32.908 pounds.

The great herd of registered Holsteins owned by The J. S. Gibson Company, Williams, will be practically dispersed at public sale on its farm on May 23-24. The decision to make this dispersal was made after the recent death of Gion W. Gibson, which was followed shortly after by the death of his mother, Mrs. J. S. Gibson. This herd has for many years held a high place among the great herds of the west, and has contributed some of the largest official records made in California, among others having developed the first cow in the state to make over 1200 pounds butter in one year. Only the younger heifers and a few cows will be retained, of the latter just enough to furnish milk for the young calves, leaving approximately 150 head to be sold.

F. F. Pellissier, Whittier, is developing some excellent records in his herd of registered Holsteins. Among the latest is that of Queen Pride Rouble with 33.06 pounds butter from 548 pounds milk in seven days and 122.91 pounds butter from 2612 pounds milk in thirty days. Miss Pontiac Model Prilly, a junior three year old daughter of the sensational King Segis Alcar-

tra Prilly, made 22.96 pounds butter from 463 pounds milk in seven days. The 11 year old cow Brudorin made the noteworthy record of over 26 pounds butter in seven days.

Herdsmen Harry L. Redd reports some more nice records from the big herd owned by Frank M. Helm, Fresno. Helm Lady Hiske Walker De Kol, a first calf three year old daughter of King Hiske Mead, made 30.12 pounds butter from 588.3 pounds milk, a California record for a first calf heifer. Eldorado May, a two year old daughter of Sir Aaggle De Kol Acme 2nd, made 21.96 pounds butter from 510.8 pounds milk. Stratford Pledge De Kol, a mature cow, made 27.14 pounds butter from 661.7 pounds milk.

The semi-dispersal of T. J. Gist & Sons' herd of registered Holsteins at Tulare on April 12 will provide an opportunity for the purchase of an attractive lot of heavy milking young cows, and as the owners are retaining their open heifers and heifer calves it means that every female in the sale is of breeding or milking age. Thirty-five of the females are bred to King Sylvia Segis Colantha, a son of the \$106,000 bull Carnation King Sylvia.

F. H. Harvey, Galt, has announced a complete dispersal of his dairy herd, which contains 160 registered Holsteins. The herd contains a large number of young cows with official records above 20 pounds butter in seven days, and many with cow testing association records made in the Sacramento-Yolo Cow Testing Association. The sale will be held April 26-27 on the Harvey Ranch, about three miles west of Galt.

George W. Thomas & Sons, Riverside, will make a semi-dispersal of their well known herd of registered Jerseys on May 9, selling all of their milking cows and bred heifers, about 50 in number. This has long been regarded as one of California's most substantial herds of Jerseys, and in view of the present wide demand for registered Jersey females the offering promises to meet with widespread interest.

E. R. Stalder, Nuevo, will make a complete dispersal of his herd of registered Holsteins on May 11. It is reported that following his sale he will be associated with Glenwood Stock Farm, Riverside, a recently organized company which plans to operate on a large scale with registered Holsteins.

The largest sale of registered Guernseys yet held in the west will take place at Hynes on April 17-18, when W. H. Dupee will sell 120 head from Edgemoor Farm, Santee. The offering will include 100 females and 20 bulls, and will help to fill the tremendous California demand for breeding Guernseys.

In order to adjust a partnership existing between E. Burr, G. M. Brown and Kenneth W. Abbott, a dispersal of the noted Burr Farm herd of registered Holsteins will be made on their farm at Los Angeles on June 1-2. The sale will contain approximately 170 head, including the famous \$12,000 bull King Korndyke Pontiac 20th. This herd has earned a place among the top collections of the breed in the west and its dispersal will offer a great opportunity for selection by new buyers and established breeders as well.

The animal husbandry division of the college of agriculture has sold the Perecheron stallion Aglionel to J. C. Wood and C. W. Christensen of Danville. Aglionel has been at the head of the university stud since the fall of 1917 and has proven himself a sire of exceptional merit. He was sired by the famous horse Aglion and is probably as closely related to the great Besigue as any horse of the breed now living. He was foaled in 1915 and stood fourth in the two year old class at the 1917 International. The price received was \$1200.

Fauvic's Star has set a new record for milk production for the Jersey

breed by producing 20,616 pounds of milk, containing 1006 pounds of but-

SEMI-DISPERSAL SALE 50 REGISTERED JERSEYS HYNES, CALIF.

at Rhoades & Rhoades Sale Pavilion
Tuesday, May 9, at 10 a.m.

Here is the opportunity registered Jersey buyers have been hoping for for months past—to find available for purchase a high class lot of Jersey females.

This sale includes every cow and bred heifer in the well known herd of GEO. W. THOMAS & SONS, Arlington, Calif., also the two herd sires. Mr. Thomas and his sons are retaining only their unbred heifers and heifer calves as foundation for their future herd.

THIS IS A HERD OF SPLENDID INDIVIDUALS, IN EXCELLENT PHYSICAL CONDITION, THE ENTIRE HERD IN MILK AVERAGING 38 LBS. BUTTER FAT PER MONTH AT THE PRESENT TIME.

The entire herd was recently tested by a Deputy State Veterinarian, and not a single animal responded to the test. Every animal guaranteed to be a breeder and sold subject to tuberculin test by the buyer.

TERMS OF SALE: Responsible parties may arrange for credit on basis of one-third cash, balance in three, six and nine months before sale with California Breeders Sales and Pedigree Company.

ter fat. The former record was held by Passport with 19,695 pounds of milk.

The pig club leader of the San Bernardino County farm bureau has announced that all pig clubs formed in San Bernardino County in the future will work exclusively with Berkshire pigs.

A new California Shorthorn breeding firm has been formed at Modesto by F. C. Woodford, L. D. Thompson and G. M. Lock. The firm is capitalized for \$50,000 and is to be known as the Golden West Shorthorn Cattle Company.

J. D. Rowe & Sons, Davis, lessees of the Alexander & Kellogg Innisfail herd of milking Shorthorns, announce a sale of 42 head of selected cows and bulls to be held at their farm on May 5. This herd has been long regarded as one of the very best collections of the breed owned in the west, and for a number of years has occupied a prominent position in the show rings. This herd probably contains more tested females than any western herd and a number of records rank among the best of the breed.

At the Fourth National Milking Shorthorn Congress at Erie, Pennsylvania, March 24-25, Queen Bapton, consigned by the Otis herd, Willoughby, Ohio, was grand champion cow, and Wampatuck Henry, consigned by Robert Saltonstall, Readville, Massachusetts, grand champion bull. The cattle were judged by W. Arthur Simpson, Lyndonville, Vermont. The congress and sale was under the management of the American Shorthorn Breeders Association, Chicago, represented by J. L. Tormey. The bulls averaged \$400 and the females \$277.

The Hartsook ranch at Lankershim has just finished some more dandy yearly records in its Holstein herd. Bessie Snow, a full aged cow, finished her work with 1,121.8 pounds butter from 27,050 pounds milk, while May Altona Pontiac made 1,106 pounds from 25,500 pounds milk. Parthena Paul Segis, who was grand champion at the Los Angeles County fair in 1920, finished with 967 pounds butter from 25,550 pounds milk.

Roy Bratzler of Algonquin, Illinois, arrived in California last week with three carloads of pure bred Holsteins. Thirty head of two and three year old heifers went to Ross Flintjer of Riverside. Mr. Flintjer is located on the ranch the California Hotel Company maintains at the head of the Box Springs grade to supply poultry and dairy products for its three big hotels in Pasadena. Twelve of these heifers are daughters of King Segis Pontiac.

A. McMinn is moving his herd of Ayrshires from Litchfield, Arizona, to Corona. Mr. McMinn is well known in California as he has shown here for a number of years with uniformly high results.

Manager Judy of the Ocean View Stock Farm at Oxnard has returned to his first love in hogs by the purchase of a fine foundation of Berkshires from the Italian Vineyard Company at Guasti. Mr. Judy was a breeder of Berkshires in the East but since being in California has been working with other breeds until recently. When the chance arose to stock the Ocean View ranch with hogs he sought out the Italian Vineyard and purchased two bred sows and ten bred gilts. Superintendent Alex Wilson fitted him out with some dandy females bred to such boars as Winona Leader Champion, the great son of Laurel Champion, who is at the head of the Guasti herd; Rincon Leader, who formerly headed the Muddox herd, and Model Leader 3d, who was grand champion at the American Berkshire Congress show at Riverside. Up to date five of the gilts have farrowed a total of 48 pigs, of which 46 are being raised. One gilt dropped the prize package of 11 sow pigs sired by Model Leader 3d. On account of the low price of sugar Ventura County is going in very largely for dairying and hog raising. Mr. Judy has his quarter section mostly in alfalfa and with the fine feed available and the excellent foundation herd of hogs he has chosen he will undoubtedly be a leader in his section.

The Better Way of Milking

(1) It Works in Harmony With the Cows

A cow's udder is extremely delicate and sensitive, and responds best to certain methods of milking—and it is due to the fact that the De Laval Milker works in harmony with the cow, in observance of the principles of milk secretion, that better results are obtained with it than with any other way of milking.

(2) Uniform Pulsation Action

Cows like and respond best to uniformity of pulsations or squeezes. Pulsation speed of the De Laval Milker is governed by a master control which is geared to the pump, and is as regular and uniform in its action as the pendulum of a clock. Every milker unit runs at exactly the same speed as the master control and cannot be changed at the whim of the operator. The De Laval is the only milker which has this feature.

(3) Pulsator Close to Udder

Vigorous and stimulating action, which cows like so well, is secured with the De Laval because the pulsator is located close to the udder. Pulsations reach the teat-cups in the shortest possible time and produce vigorous action and abrupt periods of release and massage so stimulating and soothing to the cows. The pulsator has only one moving part, is non-adjustable, re-

quires no oiling, and will run for years without attention. No other milker has these features.

(4) Alternating Action

The alternating action of the De Laval causes milk to be drawn from two teats, while the other two teats are given a massage and brief rest period. In this manner an even and continuous flow of milk is drawn from the udder—another reason why the De Laval is so successful and milks faster and better than any other way.

(5) Self-Adjusting Teat-Cups

De Laval Teat-cups fit all sizes of teats. No metal touches the teat, and the rubber liner fits snugly about the teat, permitting the vacuum to be applied only to the point of the teat and not to the sides. This, together with other exclusive advantages, accounts for the pleasing and gentle action of the De Laval Milker, and is one of the many reasons why the cows like it so well.

There are thousands of satisfied De Laval Users, many of whom state that they would get rid of their cows if they couldn't have a De Laval. Others say they wouldn't be without it for twice the price it cost, while practically all agree it produces more and cleaner milk, saves time and makes dairying more pleasant and profitable. Write for full information.

SEEDS AND PLANTS

SUDAN GRASS SEED

(The Great New Hay Crop)
First introduced in the United States 1909 from Sudan, Africa.
Culture. Strictly an annual, may be drilled or broadcasted, 15 to 25 lbs. per acre, it grows 8 to 10 ft. high, yields 3 to 10 tons per acre, two to four cuttings.
Pasture. It will yield food for six times as much stock as any other forage without irrigation. For milk cows and hogs there is no better and more abundant pasture than sudan. It will solve the hay proposition as nothing else can or will do in this climate. This seed is grown on our farm and is free from Johnson Grass.
Price—5 lbs., \$1, 10 lbs., \$1.50; 50 lbs., \$5; 100 lbs., \$8; 500 lbs., \$35; 1000 lbs., \$50.
BOWMAN'S HDWE & IMP. CO.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, Cal-ifornia. Established 50 years. Send for free book on patents.

THE CENTRAL LIVESTOCK MARKET

(Continued from Page 393.)

fourths of the rate on fat or finished animals. In California, except in case of a few special rates between certain points, the stocker and feeder animals pay the same rate as fat cattle. This is not the result of any policy of the railroads to burden the industry, but is due to a lack of concerted action to demonstrate the need of encourag-ing production by a system of more favorable freight rates. The railroads are vitally interested in more business and may be relied upon to do the fair thing when they understand the great benefits that will come to Cali-fornia from a centralized market-ing system, properly organized and operated.

Financing the Livestock Industry

The finish feeding of the animal on the ranch in California will prove a safe and an extensive investment for financial institutions and will do much to stimulate the business generally. Range paper is not so easy to redis-count, and the volume quickly ties up a lot of money. Feed lot paper is easily re-discounted, especially where there is a near-by market for the sale of the animal at any time at fair rela-tive prices, which cannot be reflected under the present system of purchase and sale. The financing of stockers is also a difficult thing because of the lack of a market for that class of ani-mals. It is too difficult and expensive without a market to try to find buy-ers in order to liquidate that class of loans, so that, unless other security is furnished, such loans are not elig-ible to re-discounting and conse-quently not usually taken. Bearing in mind that the small rancher must be depended upon for our future supply of finished meat food animals, his dis-advantage today is apparent.

The Opportunity

The slaughtering of meat food ani-mals in the city of Los Angeles is al-ready a big business, but with the increasing population of the city and surrounding country, must be ex-panded. Capital is ready to put in new plants whenever a supply of live-stock is available, but will not engage in the business on account of the ex-pense of country buying, and is unwill-ing to try to split the limited supply with concerns of long standing in this country whose personal acquaintance and schooling in the practice of ranch purchasing counts against the new-comer, but he is willing to take his chances on the open market. The opportunity for increased production lies in the development of irrigation and the use of the range lands of Southern California, that great sec-tion of country in Southern and South-eastern Nevada, the states of Utah;

Idaho, Western Wyoming, Southwest-ern Montana, Western Colorado, New Mexico, the state of Arizona, the southwestern part of Texas and old Mexico, a country which will rapidly develop agriculturally, and particularly so under the stimulus of a near-by livestock market.

The expansion of the packing busi-ness to manufacture and distribute the increased livestock supply bound to come out of this immense country, calls for a broader distribution, and with the splendid harbor facilities and rapidly growing steamship service, the logical outlet is to the Orient, west coast of South and Central America, Mexico and Alaska.

But, perhaps the greatest gain will come from a distribution of the \$25,000,000 paid to the livestock pro-ducer, who now gets paid at home and spends his money there. Under the central marketing plan, the owner would come to the market, get his money, and spend part of it at least at home. The banks would also get a substantial part of the proceeds of sale, so that the business interests would soon reap the benefits of the development of the country that be-longs to them.

Urgent Need of Market

No fair minded person will dispute the urgent need for a livestock market. Admittedly, it is the biggest conservation problem confronting Cal-ifornia at this time. In addition to what has already been said, the dairymen, purebred representatives, sheep interests and horse and mule people are anxiously waiting for a central trading point, so that not a moment should be lost in getting be-hind the movement now well under way.

There should be no plan put into effect that will cause any class or locality any hardship or force the adoption of the central marketing sys-tem by those large producers who pre-fer and are equipped to ship in train-load lots to eastern markets, although the time is near when even such large operators will feel the knife of sub-division. But no plan, however good, should be shoved down the throat of the people; rather let the plan work out the situation of its own weight, and in the meantime, ranch or range buying should not be abruptly ter-minated.

The marketing facilities should be established without packer money, and the policy of the management should be for greater and better pro-duction, which can only come from a plan that helps the producer.

SPERRY FLOUR WINS

Officials of the Sperry Flour Company are elated over cable advices to the effect that the Victory Challenge Cup, annually presented at the Glasgow Bakers' Exhi-bition, again has been awarded to Sperry flour. The cup last year was won by Sperry flour also. This exhibition in Scot-land is an annual event watched with in-tense interest by milling and baking cir-cles in Europe and this country. The fact that Sperry flour was the only flour from the United States used in the bak-ings shows how rigid are the require-ments for entries in this contest.

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERD SIRE.

OWNED JOINTLY BY
Fred Hartsook and **A.W. Morris & Sons Corporation**
LAKERSHIM, CALIF. WOODLAND, CALIF.

A REAL ARISTOCRAT

A few days ago a bull calf of splendid, sturdy type put in his appearance at the J. S. Gibson Company's ranch at Williams, Colusa County. His dam is Aaggie Korndyke of Nevada, the cow that recently completed her year's work, a 365 day semi-official record of 1,297.3 pounds butter from 30,669.5 pounds milk. The dam of Aaggie Korndyke of Nevada is a daughter of the great transmitting sire, Aaggie Cornucopia Johanna Lad, and her sire a son of Pontiac Korndyke, sire of King of the Pontiacs. His sire is Winnie Korndyke DeKol Alcartra, whose dam was Winnie Korndyke Cornucopia DeKol, with a record of 1,201.6 pounds butter from 31,034.2 pounds milk in 365 days, she being a daughter of Aaggie Cornucopia Johanna Lad. The sire of Winnie Korndyke DeKol Alcartra is Prince Alcartra Korndyke, the oldest son of Tilly Alcartra, with several daughters in the Gibson herd with records over the 30-pound mark. The young bull calf has the honor of having the first three nearest dams with an average of 1,276.5 pounds butter from 31,709 pounds milk in 365 days, and we believe this to be the highest average for the three nearest dams of any bull in the world.

There is in this same herd a one year old heifer that is a full sister to this young bull. This wonderful progeny is the result of the many years of intense study and breeding on the part of the late Gion W. Gibson.

NEW DAIRY BUILDING AT UNIVERSITY FARM

With the \$195,000 appropriation from the board of regents of the University of California and additional funds from the last legislature, a dairy industry building will be constructed at the university farm at Davis. The state legislature in 1917 appropriated funds for a building for the dairy industry department but the United States entering the war at that time made it undesirable to start its construction.

The building will consist of a two story main structure of hollow tile, 234 feet long with a dairy manufacturing wing running back 128 feet from one end of the main building. The first floor of the building will include laboratory for butter and market milk, commercial testing, student testing, farm dairy and bacteriology, and a sales room, offices and student locker room. The second floor will be occupied by three lecture rooms, seminar, reading and dairy products judging rooms, and office and storage space. The manufacturing wing will house the large creamery laboratory which will be used for teaching advanced students and those electing practice work in butter, cheese, ice cream, market milk and milk condensing.

A distinctive feature of the new dairy building is the provision for small units of equipment in each department, making it possible for each student to work independently. The increased equipment will make it possible for instructors to teach larger sections, thus accommodating a larger number of students.

SOME COWS POOR CUSTOMERS

The average man very naturally pays a great deal of attention to the amount he receives for corn, wheat or hay when he sells it on the market. He also watches the price of the butterfat very closely and it is well that he should.

But how many persons can tell how much they get for the feed consigned to their cows? The Missouri cow testing associations under the supervision of the college of agriculture, are bringing to light some interesting demonstrations along this line, according to E. M. Harmon, dairy extension specialist. In one county all of the cows in 32 herds were divided into four classes according to production of butterfat. It was found that the cows which averaged 100 pounds of butterfat per year returned 253 pounds of butterfat and 6,250 pounds of milk for each \$100 worth of feed. The cows which produced 200 pounds of butterfat per year returned 478 pounds of butterfat and 9,524 pounds of milk for each \$100 worth of feed. Those averaging 400 pounds of butterfat per year returned 560 pounds of butterfat and 10,870 pounds of milk on the same amount of feed.

In other words, one cow returns

268 pounds of butterfat and 6,250 pounds of milk for each \$100 worth of feed while her stall mate returns 56 pounds of butterfat and 10,870 pounds of milk for the same feed cost. Labor, interest and other items were considered the difference would be far greater. Certainly this is the most serious leak in our system of marketing feed and dairy products. The cow testing association is steadily reducing the waste of feed material.

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.

For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS

(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each

Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum

(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Write for free booklet on the Prevention of Anthrax.

Hurt?

WHAT if it does? Just reach up on the shelf and get that bottle of good old Gombault's Balsam. Rub just a little on the sore spot gently. It immediately relieves! One more application and every bit of the ache disappears. IT IS equally effective for bruises, cuts, burns, sprains, sores, rheumatism, stiffness of all kind, sore throat, and chest colds. In addition to its remarkable healing qualities it is absolutely safe and a perfect antiseptic.

IN thousands of homes it is the one remedy that cannot be spared. You'll feel the same way yourself after you've tried it.

GET a bottle of Gombault's Balsam today! Keep it always on hand for any emergency. It's so effective one bottle lasts a long while.

Sold by druggists, or sent by parcel post on receipt of price \$1.50 per bottle. AS A VETERINARY REMEDY Gombault's Caustic Balsam has no equal. It supercedes all cautery and firing; and never leaves a scar or discolors the hair.

keted in the mangers of low producing cows.

EARLY GAINS WITH HOGS ARE CHEAPEST

As pigs become heavier more feed is required per pound gained in weight. This general experience is sustained by definite figures recently given out by A. G. Hogan of the Missouri college of agriculture. In the summer of 1921, according to Mr. Hogan, the college conducted an investigation to find out what was the relation between the amount of feed consumed by swine and the quantity of pork produced.

Pigs weighing 100 pounds each were placed on a ration of corn, shorts and tankage and grown to weigh 300 pounds. One pig was killed and analyzed at the beginning, and others at weights of 200 and 300 pounds. All pigs were fed the same ration and kept in a dry lot so the exact amount of feed consumed could be determined. In this way it was possible to estimate the grain required per pound gain in live weight, in fat and in lean meat.

The result agreed with general experience in regard to weight. As the pigs became heavier more feed was required per pound gain. In growing from 100 to 200 pounds, 4.3 pounds grain were required per pound gain, while in growing from 100 to 300 pounds, five pounds grain per pound gain were required.

It was somewhat surprising that as the hogs became heavier the amount of feed consumed per pound gain of fat became somewhat less. While the pigs were growing from 100 to 200 pounds, 10.8 pounds feed were consumed for each pound of fat gained, and in growing from 100 to 300 pounds, 9.3 pounds feed were consumed per pound gain.

In regard to the production of lean meat the results were more favorable to the lighter hogs. In gaining from 100 to 200 pounds, 12.5 pounds feed were required for each pound gain in lean meat, and in growing from 100 to 300 pounds, 20 pounds feed were required for each pound of lean meat gained. The result indicated that when a heavy grain ration is fed, lean meat is not produced economically after a weight of 200 pounds is reached, while fat is produced most economically from that point up to and beyond 300 pounds.

SUNFLOWER SILAGE GIVES GOOD RESULTS

Sunflower silage gives as good results in fattening steers as more expensive feed, as is proven by an experiment just finished by the Washington experiment station.

This is the first of a series of experiments to be made on the feeding value of sunflower silage, the price of which per ton is \$4, as compared with \$46 for corn silage, \$48 for alfalfa hay and \$40 for cottonseed meal.

Twenty-five Shorthorn and Hereford steers were fed, 13 receiving an average daily ration of two pounds cottonseed meal, 13.2 pounds cut alfalfa hay and 39.6 pounds corn silage to each steer. The other 12 steers were fed 2.1 pounds cottonseed meal, 12.5 pounds cut alfalfa hay and 43 pounds sunflower silage.

Both lots gained 1.2 pounds per head each day of the 75 days of the test, the total gain per steer being a little over 90 pounds. The cost of feed for each steer receiving the sunflower silage was \$13.50, as compared with \$15.97 for each of the other steers. No difference in condition in the two lots could be detected.

The tops in both lots of the 18 head sold brought \$7.25 per hundredweight, the others bringing \$6.50. The steers averaged about 1,050 pounds at the close of the test. They cost about \$5 apiece as feeders.

"It is evident that there is sufficient margin for profit," said Jerry Sotola of the animal husbandry department, discussing results. "The returns from the sunflower silage fed cattle were higher than those from the corn fed cattle, because the corn was \$2 a ton higher in price."

E. A. Stuart of Seattle, Washington, owner of the Carnation Stock Farms, has been elected president of the Pacific International Livestock Exposition, Portland, and Thomas T. Miller, Shorthorn breeder of Hollister, will represent the California livestock interests on the board of directors.

SEMI-DISPERSAL

REGISTERED
60 HOLSTEINS

T. J. GIST & SONS HERD

TULARE, CALIF.

Wednesday, April 12, at 10 A.M.

T. J. Gist & Sons will sell in this sale all of their milking females and bred helpers, retaining only their open helpers and heifer calves for foundation of another herd.

THERE ARE A LARGE NUMBER OF HEAVY PRODUCING FRESH COWS IN THIS SALE, MANY WITH OFFICIAL RECORDS UP TO OVER 26 LBS. BUTTER IN 7 DAYS.

This well known herd represents most substantial breeding, the females are practically all young, and they will be presented in excellent physical condition.

35 COWS AND HEIFERS IN THE SALE ARE BRED TO KING SYLVIA SEGIS COLANTHA, A GOOD SON OF THE \$106,000 BULL CARNATION KING SYLVIA.

The sale will be held on the T. J. Gist & Sons Farm, about five miles north of Tulare. Every animal guaranteed to be a breeder; no tuberculin test certificates.

TERMS OF SALE: Responsible parties may arrange terms, if done before sale, of one-third cash, balance in three, six, and nine months with note bearing eight per cent interest. Applications for credit should be made to sale managers.

DISPERSAL SALE

161—Registered Holsteins—161

112 Females—49 Bulls

F. H. Harvey Herd, Galt, Calif.

Selling on the Farm—about Three Miles West of Galt

April 26-27

At 10 A.M. Each Day

In order to devote his time to his many other interests, Mr. F. H. Harvey has decided to make a complete dispersal of his big herd of registered Holsteins. The herd represents many of the highest producing blood lines of the breed and is of high average type.

A LARGE NUMBER OF THE FEMALES HAVE OFFICIAL RECORDS UP TO OVER 26 LBS. BUTTER IN 7 DAYS. MOST OF RECORDS MADE AS 2, 3 AND 4 YEAR OLDS.

The herd contains a considerable group of the daughters of the \$2 lb. bull SUPREME GLISTA PIETJE, whose daughters have consistently shown a high percentage of butter fat.

Many of the females sell bred to KING PONTIAC SEGIS INKA, a splendidly bred son of King of the Pontiacs, and the bull himself will sell.

DAIRYMEN SHOULD NOT OVERLOOK THE OPPORTUNITY TO BUY A PURE BRED REGISTERED BULL IN THIS SALE. THERE ARE FORTY-NINE BULLS TO SELL, MANY OF SERVICE AGE, AND THERE ARE BOUND TO BE A GREAT LOT OF BARGAINS.

TERMS OF SALE: Responsible parties may arrange before sale, with sale managers, for credit on the basis of one-third cash, balance in three, six and nine months, with notes bearing eight per cent interest.

Guaranteed Breeders—No Tuberculin Test Certificates

2 cars, 29 consignors, \$3,651.90.

Total for week, 282 hogs, 3 cars, 31 consignors, \$5,049.42.

VEGETABLES

Prices furnished by state department of agriculture, division of markets:

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Artichokes: Choice, 16.00@17.00 crate; poorer, 14.00@15.00 crate.

Asparagus: 8@15 lb.; graded, 17½.

Beans: 40 per lb.

Bunched Vegetables: Carrots, 50@60 per doz.; turnips, 45@55 per doz.; beets, 50@60 per doz.; parsley, 15@20; radishes, 36 per doz. bunches.

Cabbage: 2.00@2.55 per crate, 2 per lb., 75@1.00 per doz.

Carrots: 1.00@1.25 sack.

Caiflower: 1.25@1.50 doz.

Celery: Crate, 4.00@5.00.

Chicory: 2.25@2.50 crate.

Cucumbers: Hothouse, fancy, 2.00@3.00 per doz.; small, 3.50 per crate; English, 2.50@2.75.

Eggplant: 15@25 lb.

Endive: 40@55 lb.

Garlic: 4@6 per lb. for medium grades; poorer quality, less.

Lettuce: Imperial Valley, iced, 4.25@4.75 per crate; Los Angeles, 3.50@4.25.

Mushrooms: Ordinary, 10@30 per lb.

Olives: 5@7 per lb.

Onions: Australian cold storage browns, 8.75@9.00; white globes, nominal; green onions, 1.50@1.75 per box.

Parsnips: 1.75 per sack.

Peas: So., 12@17 per lb.

Potatoes: Rivers, fancy, 1.80@2.10; Oregon Burbanks, 1.85@2.10; Idaho Netted Gems, 1.85@2.25; off grades lower; Salinas, 2.25@2.75 per cwt.

Peppers: Florida and New Mexico, Bells, 15@25; Chilis, 5@12 lb.

Pumpkins: 70@1.00 per 90 lb sack.

Rhubarb: Sebastopol, 6@9 per lb.; Bay, 6@8 per lb.; Southern, 1.50.

Squash: Hubbard and Banana, 6@8 lb.

Spinach: 2 per lb.

Sprouts: 14@15 lb.

Sweet Potatoes: 3.50@3.90 per cwt.; Arkansas and New Mex. yams, 1.75@2.00 per 50 lb. crate.

Tomatoes: Mexican, repacked, 2.50@3.00 per Los Angeles lug; off grades, 1.50@2.25.

Turnips: 1.25@1.50 per sack.

FRESH FRUIT

Avocados: Tahiti, 1.00@6.00 cr.

Bananas: Best Eastern and Hawaiian, 6½@8 lb.

Loquats: 20@25 lb.

Pineapples: 6.00@7.00 doz.

Strawberries: 3.00@5.50 cr.

CITRUS FRUITS

Grapefruit: Cal. fancy, special pack, 3.50@4.00; Arizona, 4.25@4.50 box.

Lemons: Special pack, 4.75@5.25 box; Choice, 4.00@4.50 box; Lemonettes, 2.00@2.25.

Oranges: Special pack, 126s-160s, fancy, 6.00@6.50; 125s, 5.75@6.25; 200s-216s, 5.50@6.00.

Tangerines: 2.50@3.50 per half orange box.

APPLY

BERNAL MARL

For Crop Insurance

The Purpose of Marling Soil is to Insure Every Year a Bumper Crop Year

CALCIUM CARBONATE

is as essential to growing plants as to growing children. It supplies plants with material for fiber for maximum growth and improves the quality of fruit, hay, grain and vegetables, and increases the yield from normal soils.

Greatest Crop Asset

Bernal Marl is Northern California's greatest agricultural asset. Its proper use will return maximum profits this year. It will insure against failure of crops under adverse maturing conditions. It will decompose the vegetable matter and mellow the soil for moisture retention against the days of intense summer heat. It will overcome the acidity that destroys the process of nitrification and makes for stunted growth and soil and plant diseases. It will disintegrate the soil, releasing plant foods for the improvement of fertility. It will soften the plow sole for greater penetration of the tender feeding roots, and accomplish other material benefits in your soil. Send today for our free

New Book on Bernal Marl

This book will point the way to better profits. It has been compiled with great respect for the opinion of accepted authority, and every statement is based on demonstrated fact. It will show why Bernal Marl is second only to moisture in crop production.

Book Review

FARM MANAGEMENT

"Farm Management," a text book for the student and investigator, by R. L. Adams, professor of farm management, University of California, published by McGraw-Hill Book Company, Inc., 370 Seventh Avenue, New York, at \$4.

This is a 672 page book, containing 27 chapters touching upon general considerations of farm management, selecting farming as an occupation, selecting the farm business, selecting the farm, organizing, soil factors, calendar of operation, equipment, building equipment, fencing stock and implements, capital requirements, profits, financial forecast, management surveys, bookkeeping, cost accounting, costs of producing crops, costs of producing livestock and stock products, marketing, labor, tenancy, lease forms, law, farm management, etc. Prof. Adams is a long time resident of California, was agricultural expert and adviser for the Spreckels sugar factory and has for many years been connected with the faculty of the University of California. His abilities in farm economics, marketing and management are well known and this book will find wide reading in California. An idea of the scope of the book is best secured through a reading of the preface, the first three paragraphs of which we quote.

"The business of farming is complex and almost infinitely diverse. At the outset both the observer of its conditions and the collector of its data face variations between the widest ex-

tremes not only of soil, water, climate, topography and size of holdings, but also of individual opinion, experience, practice and ideals.

"For instance, the man so situated that possible crops are apples, peaches, oranges, lemons, walnuts or lima beans will reap different rewards from one who can raise only alfalfa or grain or who is confined to buckwheat, rye, wild grasses or pasture. Distance to and receptivity of the market are other influences which affect in a marked way such things as vegetables, poultry products, berries, whole milk, and, to a lesser extent, grains, beans, potatoes, pork, beef and sheep. For the same crops there are variations in yield because of differences in soil type, climatic conditions, age of planting, choice of variety, availability of water, need of drainage, presence of alkali, market conditions and farming method.

"The necessity to provide a proper standard of living is the basis upon which all financial estimates must stand. It is the keynote to a discussion of the financial side of agriculture. Yet ideas differ widely as to what sum is needed to provide proper living for the average family. These differences may arise from size of families, age of members, standards of living, conditions of childhood, environment, personal tastes and degree of spending activity of members of family. Thus the comforts of one family will be the luxuries of a second and the necessities of a third."

If this season's pullets in California were all to be hatched by the patient setting of the old hen there would be many thousands of her in action at this moment. But the world do move and the old hen has had to move and devote her energies to the production of eggs rather than to the rearing of chicks. So the wooden hen has come, likewise the brooders where thousands are cared for instead of "settin's." This has called for the construction of great incubator and brooder houses. One of these incubators capable of turning out 40,000 chicks every week is that of the Holly Ranch over in the San Fernando Valley. This is a really great institution and worth a visit by every poultryman.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST, 1912, of California Cultivator, published weekly at Los Angeles, Cal., for April 1, 1922.

STATE OF CALIFORNIA,

County of Los Angeles, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Frank J. Ironmonger, who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business manager are: NAME OF— POSTOFFICE ADDRESS Publisher, Cultivator Publishing Co., Los Angeles, Cal. Editor, C. B. Messenger, Los Angeles, Cal. Managing Editor, None

Bus. Mgr., Frank J. Ironmonger, Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock): Cultivator Publishing Co., Los Angeles, Cal. R. M. Teague, San Dimas, Cal. Frank J. Ironmonger, Hollywood, Los Angeles, Cal. J. H. Yetter, Los Angeles, Cal. W. R. Wood, San Dimas, Cal. E. H. Sanford, Claremont, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding one per cent or more of the total amount of bonds, mortgages, or other securities are: (If there are none, so state). None.

4. That the paragraphs next above, giving names of owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholders or security holders appear upon the books of the company as trustees or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association or corporation has any interest, direct or indirect, in the said stock, bonds or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is (This information is required from daily publications only.)

FRANK J. IRONMONGER, Business Manager, Sworn to and subscribed before me this 29th day of March, 1922.

(SEAL.)

Notary Public in and for Los Angeles County, Cal. (My commission expires Jan. 16, 1926.)

Principles of Brooding

By Jean A. Koethen

HERE are just three essentials to the successful brooding of chicks in either large or small flocks; heat, fresh air and a chance to run out-of-doors. Everything simmers down to these three things. The chick must be kept warm, but if it is kept too warm or too constantly warm, with no opportunity for becoming hardened to outdoor air it is soon stunted. If it is not warm enough it dies of chill. Without its feet on the ground, the sun on its back and its lungs filled with fresh air, it becomes a useless exotic, too weak and tender for this rough world. Knowing these principles, how shall we plan our brooder houses?

Brooder Types

The last time I wrote on this subject I said there were three methods of brooding in general use; large flock brooding, small flock brooding and fireless brooding. Today I doubt if any such division can be made. The hover system of brooding in flocks of 100 in separate runs has been superseded on practically all commercial ranches by the brooder stove or electric hover, brooding 500 or more chicks in one flock. Where it can be had at reasonable rates, electricity takes precedence of all other methods of supplying heat. It is safe, clean and easily controlled, and can be used in any sort of building. Electric hovers for flocks of from 50 chicks to 1000 may be had now at reasonable prices from the big supply houses as well as from a good many specialty dealers.

Where electricity is not available the Kresky or some other make of stove makes a splendid artificial mother, and all these stoves may be had in various sizes. I have seen them so small that several were used in one house, exactly as the hot air and hot water brooders were used, to brood 25 or 50 chicks apiece, and so large as to furnish heat for 2000 chicks around a single stove. In purchasing either electric hover or brooder stove, the purchaser has only to decide how many chicks he wishes to brood in a single flock and then order according to his needs.

Of fireless brooders and the outdoor brooders which were in quite general use a few years ago I shall not speak, except to say that I believe the hen is a far more satisfactory brooder than either. If over 500 chicks are to be raised in a season, a brooder stove or electric hover which will brood them all at once is most economical. If fewer than 500 chicks are the ultimate aim of farmer or back-lotter, he will make no mistake if he sticks to hen mothers, providing a tight coop and wire run for each mother and giving each a maximum of 25 chicks.

Why Large Flocks?

There has been some discussion as to the advisability of brooding chicks in flocks of 500 or more, but to date the ayes seem to have the best of it. Losses are greater, but labor and expense of equipment are less, and there is the great advantage of getting out all the chicks at one time, or at the most, in two flocks a month apart, rather than having them coming along all the spring in successive groups. A woman who brooded 2000 chicks around a single stove, with less than 10 per cent loss, told me she preferred them all in one flock, because if she raised them in two lots of 1000 each the second lot never did quite so well. Yards and house were not so clean, and unless birds of different ages were entirely segregated, the younger were at a great disadvantage. If she must brood two flocks, she said, she would put them several months apart, to give time for purifying the soil of their run with a crop of grain.

The large flock requires more exacting care. Ventilation, cleanliness and feeding must be guarded with unceasing vigilance; overcrowding and overheating prevented at whatever cost, but the task is soon finished, the pullets at six weeks of age ready for colony coop or laying house, cockerels gone to market, and the hatching season is over, as far as this ranch is concerned.

Brooder Houses

The typical brooder house, as I have

seen it on many ranches, is a house about 12 feet square, with its south side mostly glass. Such a house contains brooding space for 500 to 750 chicks. For 1000 chicks the house should be somewhat larger, say 16 or perhaps 20 feet square. As far as I know, there is no exact rule for cubic feet of air space per hundred chicks. Much depends on ventilation and management, but it would not be wise to attempt to brood 500 chicks in a house smaller than 12 feet square.

This brooder house or room may be supplemented by a playroom, of the same size or smaller, in which the chicks have a chance to exercise in cooler air, or it may open directly into an outside run. Both plans seem equally successful. If the outdoor run is on the south and protected from wind, an indoor playroom is only necessary in localities where high or damp winds prevail, but it will be found convenient in windy or cold weather anywhere.

I described recently a tar paper colony house, which was successfully used for brooding, and not a few poultrymen put their electric hover or Kresky stove in an empty laying house and brood their chicks there without the expense of a separate brooder house. As I said in the beginning, warmth, fresh air and exercise on the ground, are the essentials. Any house in which the chicks can be kept warm will do for brooding, but warm they must be the first few weeks, and at night always till they roost.

Study the hen and make her your model. She gives the chicks heat when they need it, exercise in cooler air when they want it, and fresh air all the time.

Poultry Queries

Conducted by Jean A. Koethen

Sick Turkeys

I have lost several turkey hens lately. One was very fat, another died a few minutes after laying, a third was weak for two or three days. All are confined. I have given ipecac and potassium permanganate in the water without results. They have grain, mash; plenty of greens and sour milk. Am I overfeeding them, and do you think they had cholera? How much grain should be fed daily to five turkeys? Where can I get 1-5000 bichloride tablets for cholera?—Subscriber, Lankershim.
